Talep Edilen Alan ve bilgileri

b.1-Arazi Kullanımı:

Sahada yapılan jeolojik çalışmalar neticesinde izne konu olan alan içerisindeki Altın+Gümüş cevherinin ekonomik olarak kullanılabilir özellikte olmasından dolayı sahada üretim yapılması planlanmıştır. Sahada yeni talep edilen 78.460,24 m2'1ik açık işletme ve 116.880,30m2'1ik kapalı işletme kısmında Altın+Gümüş üretimi yapılacaktır.95.94 m2 galeri ağzı ve 94.521,99 m2 galeri ağzı çevresi (Servis Alanı) bulunmaktadır

b.2-Altyapı Durumu:

Sahada izne konu edilecek olan toplamda 619.393,85 m2 altyapı tesis bulunmaktadır.

b.3-Tesis Durumu:

Sahada izne konu edilecek olan toplamda 240.484,63 m2 tesis bulunmaktadır.

c) Varsa geçmiş dönemlerde yapılmış olan çalışmalar hakkında bilgiler

Ruhsat alanında daha önce herhangi bir çalışma yapılmamıştır.

ç) Ruhsat alanının 1/25000 ölçekli topografik haritası ve faaliyet alanı sınırlarını ve çevresini gösteren 1/5000 ölçekli topografik harita (çevre arazi kullanımlarını da içerecektir).

Ruhsat alanı ile faaliyet alanı ve çevresini gösteren ilgili haritalar ekte sunulmuştur.

d) Rehabilite edilecek alanların, faaliyet sonrası kullanım çeşitliliği senaryolarını gösterir 1/25000 ölçekli **topografik haritalar;** (İşletme projesi ve atık yönetim planı ile uyumlu olarak)

Rehabilitasyon Projesine konu sahaların faaliyet sonrası kullanım çeşitliliğini gösterir ilgili topoğrafik harita ekte sunulmuştur.

e) Faaliyet Alanının Jeolojik Durumu.

Bölgesel Jeoloji

Proje alanının içinde yer aldığı Balıkesir iline ait jeolojik bilgiler, MTA tarafından hazırlanan 1/100.000 ölçekli Balıkesir I-19 paftasına ait jeoloji haritası baz alınarak hazırlanmıştır.

Biga Yarımadası'nda Tersiyer öncesi kayaçlar, birbirleriyle tektonik ilişkili, KD-GB konumda uzanan tektonik kuşaklar içerisinde yüzeylenmektedir. Farklı istiflerden oluşan bu zonlar doğudan batıya doğru İzmir-Ankara zonu, Sakarya zonu, Çetmi melanjı ve Ezine zonlarından oluşur. Balıkesir civarında Sakarya zonu ve İzmir-Ankara zonuna ait birimler yüzeylenmektedir. Sakarya Zonu içerisinde genel olarak amfibolit fasiyesinde metamorfizma geçirmiş olan Kazdağ metamorfitlerinden Fındıklı formasyonu yüzeylemektedir. Fındıklı formasyonu amfibollü gnays, mermer ve yer yer amfibolit ardalanmasından oluşmakta olup

SMM Ruhsat Belgesi No: 3552
ÇEVRE MÜHENDİSLERİ MENSUBU

içerisinde Altınoluk mermer üyesi ayırtlanmıştır. Bölgede küçük yüzeylenmeleri bulunan Geç Paleozoyik yaşlı Kalabak birimi Torasan ve Sazak formasyonları (mermer ve metaserpantinit mercekli metatüf, fillat ve şistlerden oluşan) ile temsil edilmekte ve düşük dereceli metamorfitlerden oluşmaktadır.

Biga Yarımadası'nın diğer bölgelerinde Kalabak birimi üzerinde uyumsuz dokanaklı, Triyas yaşlı Karakaya kompleksi yer almaktadır. Karakaya kompleksi içerisinde yer alan birimler Arkozik kumtaşları (arkozik kumtaşları ve kiltaşı ardalanmalı istif), Orhanlar grovağı (çört mercekli grovaklar), Mehmetalan formasyonu (yeşil renkli bazaltik kayaçlar ve tüfleri), Çal formasyonu (kahve-haki renkli spilitik bazalt, aglomera ve tüflerin yoğun olduğu kesimler) ve en üstte Camialan kireçtaşından oluşturmaktadır. Bahse konu birimler, birbirleri ile yer yer geçişli, çoğunlukla da tektonik dokanaklıdır. Karakaya kompleksi içinde yer alan bu litolojilerin karışık halde bulunduğu ve arazide birbirinden ayırtlanması mümkün olmayan kesimleri Karakaya formasyonu olarak adlandırılmış olup, tüm bu birimler içerisinde olistolit ve olistostromlar şeklinde Permo-Karbonifer yaşlı kireçtaşı blokları bulunmaktadır. Balıkesir bölgesinde Karakaya kompleksine ait Karakaya formasyonu ve Orhanlar grovağı yüzeylemektedir. Kalabak birimini uyumsuz dokanakla örten, Karakaya kompleksi ile tektonik dokanaklı, arkozik kumtaşı ve şeyllerden oluşan Balya formasyonu Geç Triyas yaşlıdır. Balya formasyonu ile geçişli, Karakaya kompleksini uyumsuz dokanakla örten, karasal-sığ denizel konglomera, kumtaşı, çamurtaşı ve kireçtaşından oluşan Liyas yaşlı Bayırköy formasyonu üzerinde Geç Jura-Erken Kretase yaşlı platform kireçtaşları Bilecik formasyonu olarak ayırtlanmıştır.

Bölgenin doğusunda İzmir-Ankara zonu içerisinde Permiyen-Geç Kretase yaşlı kireçtaşı blokları kapsayan Geç Kretase-Paleosen yaşlı Bornova filişi ile ofiyolitli melanjdan oluşan Yayla melanjı yer almaktadır. Bölgedeki Oligosen volkanitler, temel kayaçlar üzerinde uyumsuz olarak yer alan Tersiyer birimleri, Geç Oligosen yaşlı andezitik lav, ignimbrit, aglomera ve az oranda volkaniklastiklerden oluşan Bağburun ile andezitik ve dasidik bileşimli Hallaçlar volkanitinden oluşmaktadır. Hallaçlar volkaniti yer yer aşırı alterasyona uğramış olup, Erken Miyosene kadar etkinliğini sürdürmüştür. Erken Miyosen'den itibaren volkanik faaliyetle birlikte gölsel havzalar oluşmuştur. Bölgenin güney ve batı kesiminde andezitik Şapçı volkaniti ve Yürekli dasiti, Erken Miyosen yaşlı Soma formasyonunun konglomera, kumtaşı ve kiltaşı çökellerine eşlik etmişlerdir. Bayramiç formasyonu olarak tanımlanan Pliyosen yaşlı akarsu ve gölsel çökeller ile Kuvaterner alüvyal çökeller tüm bu birimleri uyumsuz olarak üzerlemektedir.

Proje Alanı Jeolojisi

Taban kısmında yer alan metamorfik/metasedimanter (MSed) seri, Alt Triyas yaşlı (Akyürek ve Soysal, 1989) metasilttaşı, metaçakıltaşı ve metaçamurtaşından oluşmaktadır. Bu seri, kıvrımlı bir şekilde yataya yakın konumlanmıştır ve üzerinde Alt-Orta Triyas yaşlı (Akyüz ve Okay, 1998) çamurtaşı klastları içeren kumtaşı-kuvars kumtaşı (Ssa) - çamurtaşı (Sms) ve çakıltaşı (Scs) gibi klastik bir seri bulunmaktadır. Yatayda yakın bir konumda gözlenen bu seriler arasında bir uyumsuzluk mevcuttur.

Oligo-Miyosen yaşlı (Koç vd., 1994; Duru vd., 2004) otobreş ve akma bantları içeren feldispat + biyotit ± kuvars feldispat fikrik asidik dasit-andezitik volkanikler (VIA-1/VIA-2) ise metasedimanter ve klastik serileri uyumsuzca kaplamaktadır. Bu volkanik birimlerin üzerinde, Oligo-Miyosen yaşlı felsik-aralık nitelikli multifazlı feldispat - biyotit ± hornblend (SIA1) ve

kuvars-feldispat porfirlerinden (QFP) oluşan subvolkanikler bulunmaktadır ve bunlar diğer birimleri kesmektedir.

f) Hidrolojik ve hidrojeolojik özellikler.

Bölgesel Hidrojeolojik Özellikler

Ruhsat Alanı ve çevresi için önceki çalışmalardan yararlanılarak (DSİ, 1980; Şimşek v.d., 2013), bölgedeki litolojik birimler hidrojeolojik özelliklerine göre geçirimli ve yarı geçirimli-geçirimsiz olmak üzere iki sınıfa ayrılmıştır.

Geçirimli Birimler

Bölgede allokton olarak bulunan Permiyen kireçtaşlarının, tektonizmaya bağlı olarak ikincil gözeneklilik ve atmosfere temas ettiği noktalarda ise karstik akifer özelliği göstereceği düşünülmektedir. Bu kireçtaşlarında, dokanak noktalarında 1,5 L/s ile 2,0 L/s debili kaynaklar çıkmaktadır. Balya ilçesinin içme suyu, yeraltı su kaynaklarından elde edilmektedir. Aşağı Susurluk Havzası için hazırlanmış hidrojeolojik etüt raporunda (DSİ,1980), Değirmenboğazı köyünün güneyindeki Permiyen yaşlı mermerlerin geçirgenlik özelliğinden ve bu birim üzerindeki Değirmenboğazı kaynağında gözlenen yüksek debili (100 L/s) yeraltısuyu akımından bahsedilmiştir.

Dere yataklarında, pekişmemiş kil, kum, çakıl gibi birimlerden oluşan alüvyon malzemeler sahanın sarp ve engebeli topografyasına bağlı olarak çok görülmese de çökelmenin gerçekleştiği yerlerde akifer özellik göstermektedir.

Yarı Geçirimli ve Geçirimsiz Birimler

Ruhsat alanı ve çevresinde yaygın olarak görülen Senozoyik yaşlı volkanik birimler düşük geçirimli bir yapıda olmakla birlikte akifer özelliği göstermemektedirler. Fakat bölgede tektonizmanın fazla olmasıyla birlikte, tektonik hareketlere bağlı volkanik birimlerde oluşabilecek kırık, çatlakların ikincil gözeneklilik oluşturabileceği düşünülmektedir. Bu tür yapıların geliştiği Senozoyik volkanik birimlerinin yer yer yeraltısuyu taşıyabileceği ve iletebileceği öngörülmektedir.

Senozoyik yaşlı volkanik birimlerin kesmiş olduğu Üst Triyas yaşlı kiltaşı, silttaşı, kumlu kireçtaşı ardalanmalı birimler üst seviyelerinde yer alan çakıl taşı birimlerinin göreceli olarak büyük tane boyu içeren; kumlu-çakıllı seviyelerinde yarı geçirimli akifer özelliği gösterebileceği; tane boyunun küçüldüğü, kil, silt boyu malzemenin olduğu bölümlerde yeraltısuyunu geçirmeyeceği, dolayısıyla akifer özelliği göstermeyeceği düşünülmektedir.

Ruhsat Alanları Hidrojeolojisi

Ruhsat alanları ve civarını kapsayan maden hidrojeolojisine yönelik çalışmalar (hidrojeolojik karakterizasyon ve etki değerlendirme çalışmaları) gerçekleştirilecektir. Söz konusu çalışmalar, Proje alanı ve civarında yer alan litolojik birimlerin hidrostratigrafik özelliklerinin belirlenmesi, Proje kapsamında kullanılacak ünitelerin mansap ve memba kısmında hidrojeolojik kuyuların açılması, akifer testlerinin gerçekleştirilmesi ile hidrojeolojik karakterizasyonun tamamlanarak, ruhsat sahasına özgü nümerik yeraltısuyu akım modelinin kurulması ve etki değerlendirme çalışmalarının tamamlanması gibi aşamaları kapsamaktadır.

SERBEST MESLEK MENSUBU

Proje ünitelerinin nihai konumunun belirlenmesinin ardından sahada hidrojeolojik amaçlı gözlem ve pompaj kuyularının açılarak, sahanın hidrojeolojik karakterizasyonunun belirlenmesine yönelik çalışmaların başlaması planlanmaktadır.

Proje alanının hidrojeolojik karakterizasyonunun belirlenebilmesi amacıyla, başta maden alanı (açık ocak ve yeraltı işletmesi) olmak üzere Proje ünitelerinin konumlanacağı alanlarda hidrojeolojik gözlem kuyuları açılacaktır. Kuyu lokasyonları Proje ünitelerinin iz düşüm alanları dikkate alınarak gerçekleştirilecektir. Kuyuların Proje ünitelerine ait iz düşüm alanlarının sınırında ya da yakınında açılması planlanmaktadır. Böylece Proje'nin inşaat aşamasında kuyuların iptal olmaması ve kuyularda izleme/örnekleme çalışmalarının Proje'nin ilerleyen aşamalarında da devam edebilmesi amaçlanmaktadır. Kuyu lokasyonlarının yanı sıra, kuyu sayısı ve kuyu derinlikleri ünitelerin iz düşüm alanlarına ve topografik koşullara göre belirlenecektir. Maden alanında açılacak kuyu sayısı ve bu kuyuların derinlikleri açık ocak ve yeraltı işletmesinin üç boyutlu tasarımı incelenerek nihai hale getirilecektir.

Kuyularda yapılacak olan yeraltısuyu seviye ölçümleri ve akifer testleri ile litolojilere ait hidrojeolojik özellikler belirlenecek ve Proje alanının hidrojeolojik karakterizasyonu yapılacaktır. Karakterizasyon sonrasında elde edilen bilgiler, daha sonra kurulacak olan yeraltısuyu akım modeline girdi niteliğinde olacaktır. Yeraltısuyu akım modeli ile Proje'den kaynaklanan hidrojeolojik etkilerin değerlendirilmesi sağlanacaktır.

Hidrojeolojik çalışmalara ek olarak, Proje ünitelerinin konumlarına göre, madenciliğin yapılacağı alanlardaki litolojileri temsil edecek bir jeokimyasal karakterizasyon programı oluşturulmuş ve Asit Kaya Drenajı (AKD) ve çevresel jeokimya çalışmaları yapılmaktadır.

Yeraltı Suyu Kaynaklarının Mevcut Kaliteleri

Proje alanı ve yakın çevresinde yer alan yeraltı suyu kaynaklarının mevcut kalitelerinin belirlenmesi amacı ile çevresel veri tabanı çalışmaları kapsamında yerinde ölçüm ve örnekleme çalışmaları gerçekleştirilmiştir. Bu kapsamda, 2021 yılı Mayıs ayında saha çalışmaları yapılarak belirlenen kaynaklarda, yerinde ölçümler yapılmıştır. Belirlenen yeraltı su kalitesi gözlem noktalarında 2021 yılı Mayıs, Ağustos ve Kasım aylarında ve 2024 yılı Mayıs ayında örnekler alınmış ve analizler gerçekleştirilmiştir. ÇED Alanı ve yakın çevresinde yeraltı su kalitesini belirlemek amacıyla seçilen gözlem noktalarına ait bilgiler Tablo Hata! **Belgede belirtilen stilde metne rastlanmadı.**.1'de özetlenmektedir.

Saha çalışmaları kapsamında alınan su örneklerine ait analiz sonuçları ilgili ulusal ve uluslararası su kalite standartları ile karşılaştırılmıştır. Buna göre yeraltı suları Türk Standartları Enstitüsü (TSE) TS-266, İnsani Tüketim Amaçlı Sular (2005), İnsani Tüketim Amaçlı Sular Hakkında Yönetmelik (ITASHY), Kimyasal Parametreler ve Gösterge Parametreleri, Sağlık Bakanlığı (2005), Avrupa Birliği (AB) İnsani Tüketim Amaçlı Sulara ait Kalite Kriterleri, Konsey Direktifi 98/83/EC (1998) ile İçme Suyu Kalitesi Kılavuz Değerleri, Dünya Sağlık Örgütü (DSÖ) (2017) verilerine göre değerlendirilmiştir. Bu standartlar aşağıda özetlenmektedir.

Proje alanından alınmış olan yeraltı suyu numuneleri ulusal ve uluslararası standartlar kapsamında değerlendirilmiş olup, değerlendirme sonuçları Tablo Hata! **Belgede belirtilen stilde metne rastlanmadı.**.2 ve Tablo Hata! **Belgede belirtilen stilde metne rastlanmadı.**.3'te sunulmaktadır.

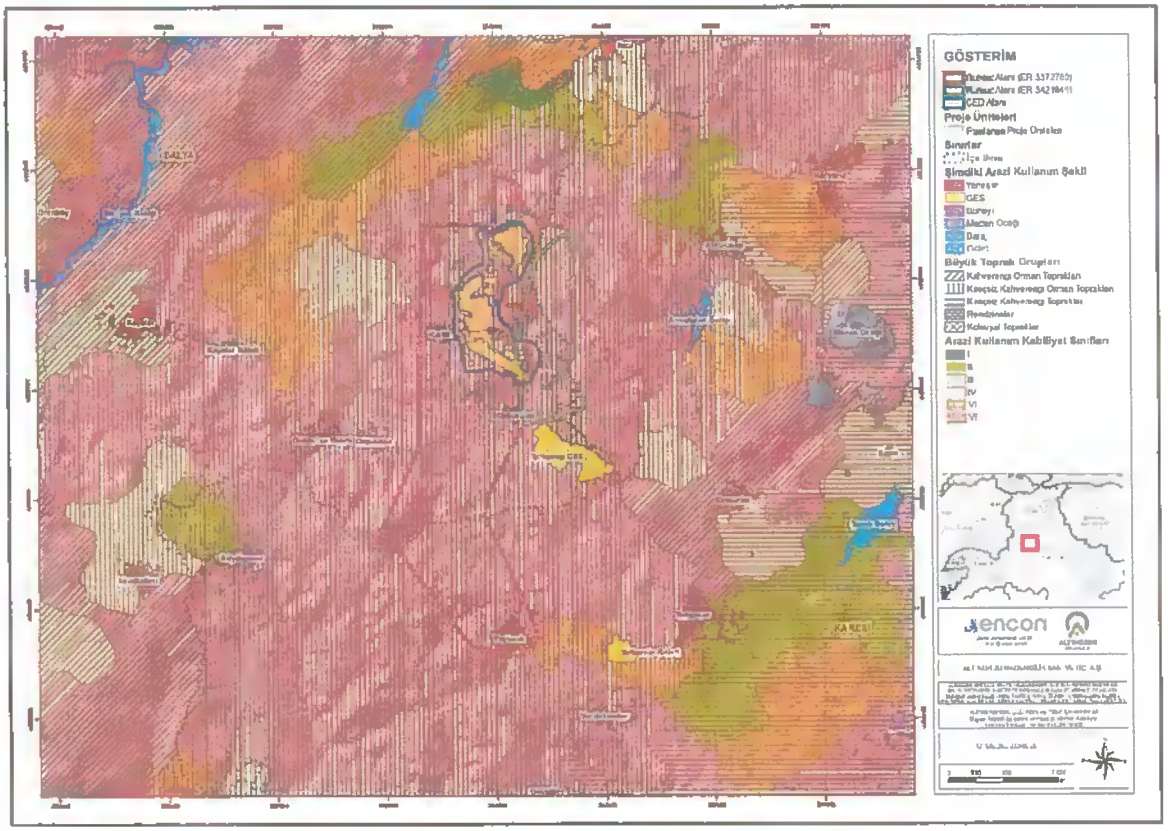
g) Örtü tabakası durumu.

Yeni Talep edilen sahanın tamamı amenajman planına ve aktüel duruma göre sahada BÇkMI, BMIMcr, Çfab2, Çfc2, Çfbc2, Çmc2, Çzab3, Çzb2, Çzbc3, Çzc1, Çzcd1, Çzcd2, MIGnab3, MIMcrab2, MIMcrb2, MIMcrbc2, MIMcrc2, Z türleri hakim olarak yer almaktadır. Ruhsat alanı tahminen Geç Oligosen ve Orta Miyosen yaşlı göreceli olarak altere olmamış andezitik volkanik, ultramafik ve alt-volkanik porfiritik kayaçlardan oluşmaktadır. Ilıca Orman İşletme Şefliği Orman Amenajman planı haritasında 59, 61, 62, 81, 82, 83, 85 no.lu bölme sınırları içerisinde kalmaktadır.

ğ) Toprak durumu.

Projeye ait ruhsat alanları içerisindeki toprak özellikleri, mülga KHGM'ye ait 1999 tarihli arazi kullanımı ve toprak özellikleri haritaları temel alınarak, Coğrafi Bilgi Sistemleri (CBS) aracılığı ile sorgulanması neticesinde değerlendirilmiştir.



Büyük toprak grupları açısından yapılan değerlendirmeye göre, ruhsat alanlarında yer alan temel toprak tipi Kireçsiz Kahverengi Orman Toprakları olup, ruhsat alanlarının %97,54'lük

ORMAN MESLEK MENSUBU

bölümünü kaplamaktadır. Alanın yaklaşık %2,46'lık bir bölümünde ise yerleşimler yer almaktadır.

Kireçsiz Kahverengi Orman Toprakları:
Bu gruptaki topraklar değişik ana kayalardan oluşmuştur. Renk ve baz durumu ana materyal ve organik madde miktarına bağlı olarak değişir. A (B) C profilli topraklardır. A horizonu iyi oluşmuştur ve gözenekli bir yapısı vardır. B horizonunu gözle ayırt etmek zordur. Kahverengi veya koyu kahverengi granüler veya yuvarlak köşeli bir yapıdadır. B horizonunda kil birikimi yok veya çok azdır. Bu horizon birçok kısımlarda yoktur ve A 1'in hemen altında C horizonu bulunmaktadır. Kireçsiz Kahverengi Orman Topraklan genellikle yaprağını döken orman örtüsü altında oluşur.

h) Flora, fauna ve lokal endemik türlerin belirlenmesi.

1) Türler, endemik türlerin listesi, yaban hayatı türlerinin listesi ve biyotoplar, ulusal ve uluslararası mevzuatla koruma altına alınan türlerin listesi,

Proje Sahası ve çevresinde yapılan saha çalışmalarında 10 endemik türe rastlanmıştır. Bunlardan 5'i bölgesel yayılışlı olup ülkemizde sadece Balıkesir ve Çanakkale illerinde yayılış göstermektedir. Bunlara ek olarak endemik olmadığı halde nadir yayılışlı olan 4 tür bulunmaktadır.

Balıkesir İlinde toplam ormanlık alanlar 632.405 hektarlık bir alan kaplamaktadır. Bu alanların 435.162 hektarı normal kapalı, 197.243 hektarı ise boşluklu kapalı imar ve ıslaha gerek duyulan ormanlardan oluşmaktadır. İlin ormanlık alan yüzdesi Orman Genel Müdürlüğü 2023 resmi istatiksel verilere göre %43 olarak ifade edilmektedir.

Literatür çalışmasında Flora için Prof. Dr. Tuna Ekim ve arkadaşlarının hazırladığı "Türkiye Bitkileri Kırmızı Kitabı", P.H.DAVIS "Flora of Turkey 1-9", Prof. Dr. Turhan Baytop'un "Türkçe Bitki Adları", Barkman J. ve arkadaşlarının "Kritische Bemerkungen und Vorschlage zur Quantitativen Vegetationanalyse" ve Yıldırım Akman'ın "Türkiye Orman Vejetasyonu"; Fauna için ise, Prof. Dr. Ali Demirsoy'un "Türkiye Omurgalıları Kırmızı Liste Kitabı" ile "Genel Zoocoğrafya ve Türkiye Zoocoğrafyası", Kiziroğlu'nun "Türkiye Kuşları Kırmızı Liste Kitabı" ile "Türkiye Kuşları Cep Kitabı" adlı eserlerden yararlanılmıştır.

İnceleme alanı Grid Kareleme sistemine göre A2 karesinde yer almaktadır. Fitocoğrafya bölgeleri; doğal ortamla ilgili yapılan çalışmalardan yararlanarak, morfolojik, klimatolojik, paleoklimatolojik, anamateryal ve toprak şartlarının belirlediği kendi içerisinde benzer özelliklere sahip, farklı yetişme muhitleri olarak ayırt edilmektedir. Anadolu, fitocoğrafya bölgeleri itibariyle; Avrupa-Sibirya (Karadeniz), İran-Turan (İç, Doğu ve Güneydoğu Anadolu Bölgeleri) ve Akdeniz (Ege, Akdeniz Bölgeleri) Fitocoğrafya bölgeleri olmak üzere üç ana gruba ayrılmaktadırlar.

Alanda yapılan arazi gözlemleri ve literatüre göre çalışma alanının Avrupa-Sibirya Floristik Bölgesi'nin Öksin alt bölgesine dahil olduğu gözlenmiştir. Ancak bölgede Akdeniz ve

İran-Turan Fitocoğrafik bölgesi elemanlarına da rastlanılmaktadır. Bu floristik bölgenin genel özellikleri ve önemli bitki listeleri ise aşağıda verilmiştir.

- Avrupa-Sibirya Fitocoğrafik Bölgesinin Sınırları ve Genel Özellikleri

Yörenin, Akdeniz fitocoğrafik bölgesinin etkisi altında kaldığı görülmektedir. Bu bölge iklimsel görüş açısından, Karadeniz hariç yurdumuzun diğer bölgeleriyle benzerlik gösterir. Zira Karadenizin dışında, yurdumuzun tamamında yaz kuraklığı karakteristiktir. Bu özellik Akdeniz iklim tipinin karakteristiği olup, bölgenin tamamı homojen bir iklim tipine sahip değildir. Bu nedenle de bitki örtüsü çeşitlilik göstermektedir.

FLORA LİSTESİ		
Familya	**Tür Adı**	**Türkçe Adı**
PAPAVERACEAE	***Corydalis wendelboi* subsp. *congesta* (bölgesel endemik)**	**Sıktarlakuşu**
ASTERACEAE	***Cirsium balikesirense* (bölgesel endemik)**	**Köygöçüren**
SCROPHULARIACEAE	***Digitalis trojana* (bölgesel endemik)**	**Kapıdağ yüksük otu**
IRIDACEAE	***Crocus candidus* (bölgesel endemik)**	**Akçiğdem**
UMBELLIFERAE	***Feulago trojana* (bölgesel endemik)**	**Kale kişnişi**
SCROPHULARIACEAE	***Verbascum parviflorum* (endemik)**	**Sığırkuyruğu**
UMBELLIFERAE	***Feulago humilis*(endemik)**	**Kılkuyruk**
LAMIACEAE	***Stachys cretica* subsp *smyrnaea* (endemik)**	-
LILIACEAE	***Muscari latifolia* (endemik)**	**Köpek sümbülü**
LAMIACEAE	***Thymus zygioides* var. *lycaonicus* (endemik)**	**Kaya kekiği**
BRASSICACEAE	***Rorippa thracica* (endemik değil, nadir)**	-
ASTERACEAE	***Crepis rubra* (endemik değil, nadir)**	**Pembe kıskıs**
SCROPHULARIACEAE	***Verbascum aschersonii* (endemik değil, nadir)**	**Çansığırkuyruğu**
PRIMULACEAE	***Cyclamen hederifolium* (nadir)**	**Kandilkökü**

Bütün Akdeniz Bölgesinde görüldüğü gibi, tahrip gören ormanların yerini maki toplulukları almış, maki topluluklarının da tahrip görmesiyle frigana formasyonları oluşmuştur. İlin

yüksek kesimlerinde Karaçam, Kayın ve Göknar türleri saf veya karışık ormanlar oluşturmaktadır.

Habitat numaraları;

1. **Yaprak Döken Karışık Meşe Ormanları (G1.7)**
2. ***Pinus brutia* ormanı (G3.7)**
3. **Maki (F5.2)**
4. **Otlatılan mesotrofik çayırlık (E2.1)**
5. ***Pinus pinea* plantasyonu (G3.F)**
6. **Akdeniz Riparian galeri ormanları (G1.3)**
7. **Kuru kaya habitatları (H3.6)**

2) Nadir ve nesli tehlikeye düşmüş türlerin listesi ve bunların yaşama ortamları, bunlar için belirlenen koruma kararları,

Proje sahasında yapılan çalışmalar neticesinde nadir yayılışlı ve uluslararası tehlike kategorilerinde bulunan türler gözlemlenmiştir. Bu türler için belirlenen koruma alanlarına rastlanmamıştır.

T.C.
Mura[illegible]LGEN
Orman Mühendisi
OMO Sicil No: 13186
Diploma No: 113020104
SMM Ruhsat Belgesi No: 3585
ÜMİT MESLEK MENSUBU

3) Yaban hayvanları ve bunların popülasyonu ile yaşama ortamları.

Proje sahasında *Lepus europaeus* – Yabani tavşan, *Erinaceus concolor* – Kirpi, *Vulpes vulpes* – Kızıl tilki, *Testudo graeca* – Tosbağa, *Hyla orientalis* – Ağaç kurbağası gibi türlere rastlanılabilmektedir.

ı) Meteorolojik özellikler.

Balıkesir il sınırları içerisinde bulunan büyük ve küçük klima istasyonlarının yıllık yağış miktarları ile yıllık ortalama sıcaklıkları esas alınarak Koppen'e göre iklim tasnifi yapılmış ve tüm istasyonların ortak iklimler kuşağına dahil olduğu tespit edilmiştir. Balıkesir il sınırları içerisindeki tüm istasyonların kuruluşundan 2024 yılına kadar olan Meteorolojik kayıtları incelenmiş ve ilin genel iklim durumu ortaya çıkarılmıştır. Balıkesir Akdeniz iklimi ile Karadeniz iklimi arasındaki geçiş bölgesinde bulunmaktadır.

Bu nedenle her iki iklimin özelliklerini yer yer görmek mümkündür. Ege kıyılarında bulunan istasyonlarda yazları sıcak ve kurak, kışları ılık ve genellikle yağışlı Akdeniz iklimi görülmektedir. Marmara kıyılarında ise Karadeniz ikliminin etkisiyle yazlar nispeten serin geçmektedir. Kıyılardan iç kesimlere doğru gidildikçe iklim karasallık eğilimi göstermekte ve kışlar soğuk geçmektedir.

Genel olarak Kuzeyden esen rüzgarların hakimiyeti altındadır. Ancak yıl içerisinde hava ve mevsimlere göre farklılıklar gösterir.

Kış aylarından aralıkta kuzey ve Kuzeybatı öbür aylar ise güney ve güneybatı yönlü esmektedirler.

Yıllık sıcaklık ortalaması 12,8 °C'dir. Ortalama en sıcak ay Temmuz ve Ağustos 22,2 °C, en soğuk ay Ocak 3,4 °C'dir. Yıllık maksimum sıcaklık değeri 40,9 °C ile Temmuz, minimum sıcaklık değeri – 11,4 °C ile Ocak ayında görülmüştür. Özellikle yaz aylarında kuzeyli rüzgarların ve yüksek sıcaklığın etkisiyle buharlaşma meydan gelmektedir. Balıkesir'de son 20 yılda en fazla yağış Ocak ayında görülmüştür. İlin yıllık yağış toplamı 663,2 mm/m² dir.

Balıkesir/Akçakiede Radar Sahası (2005 - 2024)	OCAK	ŞUBAT	MART	NİSAN	MAYIS	HAZİRAN	TEMMUZ	AĞUSTOS	EYLÜL	EKİM	KASIM	ARALIK	YILLIK

(3) Faaliyet esnasında ve sonrasında yapılacak çalışmalar:

a) Faaliyet esnasında oluşabilecek etkilere karşı alınacak önlemler

1) Korunması gereken toprak ile ilgili yapılacak işlemler. (Verimli toprağın kaybını en aza indirecek sıyırma tekniği, depolanacak alanın tesviye edilmesi, eğimin 1/3 olması, drenaj kanalı açılması, taşınması, izin verilecek alanda depolanması, korunması, tel çit çekilmesi ve levha konulması)

Verimli toprak üretime başlamadan önce üst ve alt toprak olarak ağaç köklerinin yayıldığı toprağın (fizyolojik derinliğin) tamamı arazi meyli ve arazi kotu dikkate alınarak ekskavatör ve yükleyici yardımıyla yukarıdan aşağıya doğru sıyrılarak verimli toprak depolama alanına depolanacaktır. Depolanan verimli toprağın biyolojik aktivitesini kaybetmemesi için gerekli önlemler alınacaktır. Bu işlem üretime geçmeden önce malzeme alınacak alanın temizlenmesi şeklinde yapılmakta olup, faaliyet süresince devam edecektir.

Toprak depolama alanlarında oluşturulan şevlerin stabilizesini ve araçlarla makinelerin kolayca manevra yapabilmelerini sağlamak için şev eğimlerinin azami 1/3 olacak şekilde düzenlenecek, basamaklarının genişliğinin en az 10 metre olacak şekilde planlanacaktır. Toprağın sıkışmasını önlemek maksadıyla toprak depolama alanında yüzey düzeltmeleri ağır olmayan paletli veya tekerlekli araçlar ile yapılacaktır. Bu alanlara toprak dışında, pasa, evsel atık, tıbbi atık, inşaat, yıkıntı, hafriyat atıkları dökülmeyecektir. Toprak depolama alanının kaybolmaması için, alan etrafına drenaj kanalı açılacak ve yeteri miktarda açıklayıcı tabelanın alanın görülebilecek noktalarına konulması sağlanacaktır. Tabelalar 100 cm x 150 cm boyutlarında ve beyaz zemin üzerine kırmızı harflerle yazılmış olup sağlam bir şekilde zemine sabitlenecektir. Toprak depolama alanında oluşturulan yamaçlarda veya basamaklarda yağış suları ile taşınma ve yarıntıların oluşmaması, kayma ve göçmelerin engellenmesi maksadıyla toprak tamamen nakledildikten sonra toprağı tutucu bitki

T.C.
Murat [illegible]
Orman Mühendisi
SOMO Sicil No : 13186
Diploma No : 2011020100334
SMM Belgesi No : 3
MESLEK MENSUBU

ekimi ve dikimi yapılacak, yüzeyin bitkilendirilmesi ve köklerle kaplanması sağlanacaktır.

2) Rehabiliteye konu izin talep alanının sınırlandırılması ve uyarı-tanıtım levhalarının uygun yerlere yerleştirilmesi:

İşletme, Tesis ve altyapı tesis alanının etrafına, sahaya dışarıdan girilmesi halinde tehlikeli olacağını belirten ikaz levhaları konulacak, saha etrafı gerekli olan korumaya alınacak, dışarıdan girişler engellenecektir. Çalışanların bu konularda eğitimleri sağlanacaktır.

3) Şevler, basamaklar, ocak çukurları, yeraltı ocağı giriş ve çıkışları, tasmanlar ile ilgili yapılacak işlemler ve alınacak güvenlik önlemleri:

Basamak genişliği 5 m, basamak yüksekliği 10 m olarak planlanmıştır. Uygulamada Madencilik yönetmeliği ve madencilik faaliyeti ile bozulan arazilerin doğaya yeniden kazandırılması yönetmeliği ve işletme projesine uyumlu olarak çalışma yapılacak olup şev stabilitesini sağlamak amacı ile şev açısı 70° 'yi geçmeyecektir. Üretim alanında oluşan şevlerde kavlak ve düşme tehlikesi olan taş bırakılmayacaktır. Ocak üretim alanında çukur oluşturulmayacak ve su birikmesine karşı gerekli drenaj alt yapısı oluşturulacaktır.

4) Pasa döküm alanı, atık barajı, liç, atık kazanma ve atık bertaraf tesisi vb. yerlerle ilgili işlemler ve alınacak güvenlik önlemleri:

İşletme projesi ve Çevre Şehircilik ve İklim Değişikliği Bakanlığına sunulan atık yönetim planı ile uyumlu olacak. Pasa, atık sahaları ve üst toprak depolama alanları çevresinde uyarı -ikaz levhaları konulacak ve gereksiz girişlerin önlenmesi için saha etrafı korumaya alınacaktır.

b) **Rehabilitasyona konu alanların madencilik faaliyetine kapandıktan sonra olabilecek, süren etkiler ve bu etkilere karşı alınacak önlemler**

1) Maden işletme alanında oluşturulan boşlukların ve kazı alanlarının rehabilitesi:

Oluşabilecek boşluklar önceden depolanmış dekapaj ile doldurulacaktır. Şev ve basamaklar madencilik yönetmeliği ve madencilik faaliyeti ile bozulan arazilerin doğaya yeniden kazandırılması yönetmeliğine uygun şekilde düzenlenecektir.

2) Pasa döküm alanı, atık barajı, liç, atık kazanma ve atık bertaraf tesisi vb. sahalarda Maden atık yönetmeliği kapsamında Çevre Şehircilik ve İklim Değişikliği Bakanlığı yetkisinde olan denetim ve planlama işlemlerine ait atık yönetim planı bilgisi:

Döküm harmanlarının şev ve basamakları madencilik yönetmeliği ve madencilik faaliyeti ile bozulan arazilerin doğaya yeniden kazandırılması yönetmeliğine uygun şekilde düzenlenecektir. Çevre Şehircilik ve İklim Değişikliği Bakanlığı Atık yönetim planına uyulacaktır.

3) Olası erozyona karşı gerekli önlemlerin alınması: Basamakların ve pasa döküm alanlarındaki stabiliteyi bozacak etkilere karşı drenaj vb. önlemlerin alınması:

Sahada ortalama meyil 2-6 arasındadır. Sahada erozyon söz konusu olmayacaktır. Bu nedenle erozyon tedbiri alınmasına gerek bulunmamaktadır. Pasa ve depolama alanlarındaki stabiliteyi bozabilecek akışlara karşı drenaj hendeği açılacaktır.

4) Yeniden düzenlenen alanlara depolanan verimli toprağın serilmesi ile habitat oluşumuna uygun hale getirilmesi:

Üst toprak alanında depolanmış olan nebati toprak makine ve insan gücü ile uygun şekilde serilerek doğaya uyumlu hale getirilecektir.

5) Faaliyet sonrası rehabilite edilen alanlardaki ekolojik değişimin takibi ile emniyet ve güvenlik amacıyla sahanın gözlem araçlarıyla ızlenmesi:

Ruhsat sahibi 3 (üç) yıl süreyle Rehabilite edilen alandan sorumlu olacaktır.

(4) Karbon bilançosunun hesap edilmesi: İzin verilen sahada örtünün kaldırılması sonucu oluşacak karbon miktarı kaybı ile yapılacak rehabilitasyon çalışmaları sonucunda elde edilecek karbon kazanımı

Karbon Hesap Tablosu ekte sunulmuştur.

(5) Rehabilite çalışması çerçevesinde yapılacak çalışmalar için uygulama takviminin hazırlanması. (Faaliyet esnasında ve sonrasında yapılacak çalışmalar ile ilgili iş akış planlamasının cetvel halinde hazırlanması, görsel araçlarla aşamaların arşive edilmesi)

a) Faaliyet alanını düzenleme: Atık, artıkların bertarafı ve düzenlenmesi, servis alanlarının kaldırılması: 2 ay

b) Faaliyet sahasının doğaya uygun hale getirilmesi: Çalışma sırasında en az kayıpla üst toprağın sıyrılması sonucu depolanan üst toprağın dekapajla doldurulan alanlara serilmesi oluşabilecek boşlukların doldurulması, çalışma alanlarının tesviyesi, bozulan topoğrafyanın morfolojik duyarlılığının sağlanması: 3 ay

c) Arazi duraylılığının sağlanması: Şev açılarının yönetmeliğe uygun hale getirilmesi: 2 ay

d) Arazinin doğaya uygun hale getirilmesi için gerekli ortamın hazırlanması: 2 ay

e) Faaliyet alanlarının kapatılması ve Orman işletmesine teslim edilmesi: Orman işletmesi ile gerekli istişarenin yapılarak görülen eksikliklerin giderilmesi ve idareye teslime hazır hale getirilmesi: 2 ay

1.Aşama; a) Toprak üstü canlı biyokütle (ton), **TÜB=DGH x FKA x BGF**

DGH = Her ağaç türü ya da ağaç türü gurubu için toplam dikili kabuklu gövde hacmini (m^3),

FKA = Her tür ya da tür grubu için daha önce saptanan (Yapraklılar için 0,541 t/m^3 iğne yapraklılar için 0,446 t/m^3) taze gövde odunu hacminin fırın kurusu ağırlığı (t/m^3),

BGF = Her ağaç türü ya da ağaç türü gurubu için dikili kabuklu gövde hacmine karşılık gelen biokütleyi toprak üstü toplam biokütleye genişletmek için (yapraklılarda **1,31** İğne yapraklılarda **1,212**) kullanılan genişletme faktörleridir.

b) Toprak altı canlı biyokütle (ton), **TAB=TÜB xR**

R = Kök/Sak oranı: Ağacın toprak üstü bitkisel kütlesini kökler dahil tüm ağaca dönüştürme katsayısıdır. Kök/Sak oranı (R) için FRA-2010 kılavuzundan Türkiye'nin bulunduğu iklim kuşağı ve ormanlarda bulunan ortalama servet dikkate alınarak;

R=Yapraklı Verimli ormanlar için= **0,24** R=İbreli Verimli ormanlar için= **0,29** R=Yapraklı Bozuk ormanlar için= **0,46** R=İbreli Bozuk ormanlar için= **0,40**

2.Aşama; Toprak Üstü Karbon Miktarı; **TÜK=TÜB x CF** ve Toprak Altı Karbon Miktarı; **TAK= TAB x CF**

CF = Yapraklı ormanlar için karbon miktarına dönüştürme faktörü **(0,48),** CF = İbreli ormanlar için karbon miktarına dönüştürme faktörü **(0,51),**

3.Aşama; Ölü Odun Karbon Miktarı; **ÖOK=TÜB x 0,01 x 0,47 (Ölü odun içindeki karbon miktarını hesaplamak için FRA (2010) kılavuzuna göre karbon dönüştürme faktörü (CF) 0,47 olarak alınmaktadır)** (dikili kuru ve devrik ağaçlar için TÜB nin % 1 i kabul edilmiştir.

4. Aşama; Ölü Örtü İçindeki Karbon Miktarı; **ÖÖK=Alan x F** Tolunay ve Çömez (2008)'in yaptığı çalışmalara göre Türkiye için F değerleri;

F1;İbreli Verimli ormanlar için; 7,5 ton/ha F2; Yapraklı Verimli ormanlar için; 3,8 ton/ha F3; İbreli Bozuk ormanlar için; 1,9 ton/ha Yapraklı Bozuk ormanlar için; 1 ton/ha

5.Aşama; OTK = Alan x S Toprak İçindeki Organik Karbon Miktarı; Tolunay ve Çömez (2008)'in yaptığı çalışmalara göre Türkiye'deki orman topraklarında birim alandaki ordanik karbon stokları için S1;İbreli Verimli ormanlar için; 77 ton/ha S2; Yapraklı Verimli ormanlar için; 85 ton/ha S3;İbreli Boşluklu Kapalı ormanlar için; 19 ton/ha S4; Yapraklı Boşluklu Kapalı ormanlar için; 21 ton/ha

Altyapı Tesisi Alan Dökümü:

Alan Adı	Rehabilitasyona Konu Alan (m²)	Rehabilitasyona Konu Olmayan Alan (m²)	İzne Konu Toplam Alan (m²)
Patlayıcı Madde Depolama Alanı	0	10000.00	10000.00
Bitkisel Toprak Depolama Alanı	0	2220.65	2220.65
Servis Yolu	0	7069.53	7069.53
TOPLAM ALAN: 19290.18 m²			

Talep Edilen Alan ve bilgileri

b.1-Arazi Kullanımı:

Sahada yapılan jeolojik çalışmalar neticesinde izne konu olan alan içerisindeki Altın+Gümüş cevherinin ekonomik olarak kullanılabilir özellikte olmasından dolayı sahada üretim yapılması planlanmıştır. Sahada yeni talep edilen 31197.84 m²'lik kapalı işletme kısmında Altın+Gümüş üretimi yapılacaktır.4.06 m² galeri ağzı ve 31014.39 m² galeri ağzı çevresi(Servis Alanı) bulunmaktadır.

b.2-Altyapı Durumu:

Sahada izne konu edilecek olan 10.000 m² patlayıcı madde depolama alanı, 2220.65m² bitkisel toprak depolama alanı ve 7069.53 m² seviş yolu olmak üzere toplamda 19.290,18 m² altyapı tesis bulunmaktadır.

SERBEST MESLEK MENSUBU

b.3-Tesis Durumu:

Sahada izne konu edilecek tesis bulunmamaktadır.

c) Varsa geçmiş dönemlerde yapılmış olan çalışmalar hakkında bilgiler

Ruhsat alanında daha önce herhangi bir çalışma yapılmamıştır.

ç) Ruhsat alanının 1/25000 ölçekli topografik haritası ve faaliyet alanı sınırlarını ve çevresini gösteren 1/5000 ölçekli topografik harita (çevre arazi kullanımlarını da içerecektir).

Ruhsat alanı ile faaliyet alanı ve çevresini gösteren ilgili haritalar ekte sunulmuştur.

d) Rehabilite edilecek alanların, faaliyet sonrası kullanım çeşitliliği senaryolarını gösterir 1/25000 ölçekli **topografik haritalar;** (İşletme projesi ve atık yönetim planı ile uyumlu olarak)

Rehabilitasyon Projesine konu sahaların faaliyet sonrası kullanım çeşitliliğini gösterir ilgili topoğrafik harita ekte sunulmuştur.

e) Faaliyet Alanının Jeolojik Durumu.

Bölgesel Jeoloji

Proje alanının içinde yer aldığı Balıkesir iline ait jeolojik bilgiler, MTA tarafından hazırlanan 1/100.000 ölçekli Balıkesir I-19 paftasına ait jeoloji haritası baz alınarak hazırlanmıştır.

Biga Yarımadası'nda Tersiyer öncesi kayaçlar, birbirleriyle tektonik ilişkili, KD-GB konumda uzanan tektonik kuşaklar içerisinde yüzeylenmektedir. Farklı istiflerden oluşan bu zonlar doğudan batıya doğru İzmir-Ankara zonu, Sakarya zonu, Çetmi melanjı ve Ezine zonlarından oluşur. Balıkesir civarında Sakarya zonu ve İzmir-Ankara zonuna ait birimler yüzeylenmektedir. Sakarya Zonu içerisinde genel olarak amfibolit fasiyesinde metamorfizma geçirmiş olan Kazdağ metamorfitlerinden Fındıklı formasyonu yüzeylemektedir. Fındıklı formasyonu amfibollü gnays, mermer ve yer yer amfibolit ardalanmasından oluşmakta olup, içerisinde Altınoluk mermer üyesi ayırtlanmıştır. Bölgede küçük yüzeylenmeleri bulunan Geç Paleozoyik yaşlı Kalabak birimi Torasan ve Sazak formasyonları (mermer ve metaserpantinit mercekli metatüf, fillat ve şistlerden oluşan) ile temsil edilmekte ve düşük dereceli metamorfitlerden oluşmaktadır.

Biga Yarımadası'nın diğer bölgelerinde Kalabak birimi üzerinde uyumsuz dokanaklı, Triyas yaşlı Karakaya kompleksi yer almaktadır. Karakaya kompleksi içerisinde yer alan birimler Arkozik kumtaşları (arkozik kumtaşları ve kiltaşı ardalanmalı istif), Orhanlar grovağı (çört mercekli grovaklar), Mehmetalan formasyonu (yeşil renkli bazaltik kayaçlar ve tüfleri), Çal formasyonu (kahve-haki renkli spilitik bazalt, aglomera ve tüflerin yoğun olduğu kesimler) ve en üstte Camialan kireçtaşından oluşturmaktadır. Bahse konu birimler, birbirleri ile yer yer geçişli, çoğunlukla da tektonik dokanaklıdır. Karakaya kompleksi içinde yer alan bu litolojilerin karışık halde bulunduğu ve arazide birbirinden ayırtlanması mümkün olmayan kesimleri Karakaya formasyonu olarak adlandırılmış olup, tüm bu birimler içerisinde olistolit ve olistostromlar şeklinde Permo-Karbonifer yaşlı kireçtaşı blokları bulunmaktadır. Balıkesir bölgesinde Karakaya kompleksine ait Karakaya formasyonu ve Orhanlar grovağı yüzeylemektedir. Kalabak birimini uyumsuz dokanakla örten, Karakaya kompleksi ile tektonik dokanaklı, arkozik kumtaşı ve şeyllerden oluşan Balya formasyonu Geç Triyas yaşlıdır. Balya

formasyonu ile geçişli, Karakaya kompleksini uyumsuz dokanakla örten, karasal-sığ denizel konglomera, kumtaşı, çamurtaşı ve kireçtaşından oluşan Liyas yaşlı Bayırköy formasyonu üzerinde Geç Jura-Erken Kretase yaşlı platform kireçtaşları Bilecik formasyonu olarak ayırtlanmıştır.

Bölgenin doğusunda İzmır-Ankara zonu içerisinde Permiyen-Geç Kretase yaşlı kireçtaşı blokları kapsayan Geç Kretase-Paleosen yaşlı Bornova filişi ile ofiyolitli melanjdan oluşan Yayla melanjı yer almaktadır. Bölgedeki Oligosen volkanitler, temel kayaçlar üzerinde uyumsuz olarak yer alan Tersiyer birimleri, Geç Oligosen yaşlı andezitik lav, ignimbrit, aglomera ve az oranda volkaniklastiklerden oluşan Bağburun ile andezitik ve dasidik bileşimli Hallaçlar volkanitinden oluşmaktadır. Hallaçlar volkaniti yer yer aşırı alterasyona uğramış olup, Erken Miyosene kadar etkinliğini sürdürmüştür. Erken Miyosen'den itibaren volkanik faaliyetle birlikte gölsel havzalar oluşmuştur. Bölgenin güney ve batı kesiminde andezitik Şapçı volkaniti ve Yürekli dasiti, Erken Miyosen yaşlı Soma formasyonunun konglomera, kumtaşı ve kiltaşı çökellerine eşlik etmişlerdir. Bayramiç formasyonu olarak tanımlanan Pliyosen yaşlı akarsu ve gölsel çökeller ile Kuvaterner alüvyal çökeller tüm bu birimleri uyumsuz olarak üzerlemektedir.

Proje Alanı Jeolojisi

Taban kısmında yer alan metamorfik/metasedimanter (MSed) seri, Alt Triyas yaşlı (Akyürek ve Soysal, 1989) metasilttaşı, metaçakıltaşı ve metaçamurtaşından oluşmaktadır. Bu seri, kıvrımlı bir şekilde yataya yakın konumlanmıştır ve üzerinde Alt-Orta Triyas yaşlı (Akyüz ve Okay, 1998) çamurtaşı klastları içeren kumtaşı-kuvars kumtaşı (Ssa) - çamurtaşı (Sms) ve çakıltaşı (Scs) gibi klastik bir seri bulunmaktadır. Yatayda yakın bir konumda gözlenen bu seriler arasında bir uyumsuzluk mevcuttur.

Oligo-Miyosen yaşlı (Koç vd., 1994; Duru vd., 2004) otobreş ve akma bantları içeren feldispat + biyotit ± kuvars feldispat fikrik asidik dasit-andezitik volkanikler (VIA-1/VIA-2) ise metasedimanter ve klastik serileri uyumsuzca kaplamaktadır. Bu volkanik birimlerin üzerinde, Oligo-Miyosen yaşlı felsik-aralık nitelikli multifazlı feldispat - biyotit ± hornblend (SIA1) ve kuvars-feldispat porfirlerinden (QFP) oluşan subvolkanikler bulunmaktadır ve bunlar diğer birimleri kesmektedir.

f) Hidrolojik ve hidrojeolojik özellikler.

Bölgesel Hidrojeolojik Özellikler

Ruhsat Alanı ve çevresi için önceki çalışmalardan yararlanılarak (DSİ, 1980; Şimşek v.d., 2013), bölgedeki litolojik birimler hidrojeolojik özelliklerine göre geçirimli ve yarı geçirimli-geçirimsiz olmak üzere iki sınıfa ayrılmıştır.

Geçirimli Birimler

Bölgede allokton olarak bulunan Permiyen kireçtaşlarının, tektonizmaya bağlı olarak ikincil gözeneklilik ve atmosfere temas ettiği noktalarda ise karstik akifer özelliği göstereceği düşünülmektedir. Bu kireçtaşlarında, dokanak noktalarında 1,5 L/s ile 2,0 L/s debili kaynaklar çıkmaktadır. Balya ilçesinin içme suyu, yeraltı su kaynaklarından elde edilmektedir. Aşağı Susurluk Havzası için hazırlanmış hidrojeolojik etüt raporunda (DSİ,1980), Değirmenboğazı köyünün güneyindeki Permiyen yaşlı mermerlerin geçirgenlik özelliğinden ve bu birim

Orman Mühendisi
OMO Sicil No: 13186
Oda No: SMM020100
SMM Onaylı Belge No: [illegible]
UZMAN MESLEK MENSUBU

üzerindeki Değirmenboğazı kaynağında gözlenen yüksek debili (100 L/s) yeraltısuyu akımından bahsedilmiştir.

Dere yataklarında, pekişmemiş kil, kum, çakıl gibi birimlerden oluşan alüvyon malzemeler sahanın sarp ve engebeli topografyasına bağlı olarak çok görülmese de çökelmenin gerçekleştiği yerlerde akifer özellik göstermektedir.

Yarı Geçirimli ve Geçirimsiz Birimler

Ruhsat alanı ve çevresinde yaygın olarak görülen Senozoyik yaşlı volkanik birimler düşük geçirimli bir yapıda olmakla birlikte akifer özelliği göstermemektedirler. Fakat bölgede tektonizmanın fazla olmasıyla birlikte, tektonik hareketlere bağlı volkanik birimlerde oluşabilecek kırık, çatlakların ikincil gözeneklilik oluşturabileceği düşünülmektedir. Bu tür yapıların geliştiği Senozoyik volkanik birimlerinin yer yer yeraltısuyu taşıyabileceği ve iletebileceği öngörülmektedir.

Senozoyik yaşlı volkanik birimlerin kesmiş olduğu Üst Triyas yaşlı kiltaşı, silttaşı, kumlu kireçtaşı ardalanmalı birimler üst seviyelerinde yer alan çakıl taşı birimlerinin göreceli olarak büyük tane boyu içeren; kumlu-çakıllı seviyelerinde yarı geçirimli akifer özelliği gösterebileceği; tane boyunun küçüldüğü, kil, silt boyu malzemenin olduğu bölümlerde yeraltısuyunu geçirmeyeceği, dolayısıyla akifer özelliği göstermeyeceği düşünülmektedir.

Ruhsat Alanları Hidrojeolojisi

Ruhsat alanları ve civarını kapsayan maden hidrojeolojisine yönelik çalışmalar (hidrojeolojik karakterizasyon ve etki değerlendirme çalışmaları) gerçekleştirilecektir. Söz konusu çalışmalar, Proje alanı ve civarında yer alan litolojik birimlerin hidrostratigrafik özelliklerinin belirlenmesi, Proje kapsamında kullanılacak ünitelerin mansap ve memba kısmında hidrojeolojik kuyuların açılması, akifer testlerinin gerçekleştirilmesi ile hidrojeolojik karakterizasyonun tamamlanarak, ruhsat sahasına özgü nümerik yeraltısuyu akım modelinin kurulması ve etki değerlendirme çalışmalarının tamamlanması gibi aşamaları kapsamaktadır. Proje ünitelerinin nihai konumunun belirlenmesinin ardından sahada hidrojeolojik amaçlı gözlem ve pompaj kuyularının açılarak, sahanın hidrojeolojik karakterizasyonunun belirlenmesine yönelik çalışmaların başlaması planlanmaktadır.

Proje alanının hidrojeolojik karakterizasyonunun belirlenebilmesi amacıyla, başta maden alanı (açık ocak ve yeraltı işletmesi) olmak üzere Proje ünitelerinin konumlanacağı alanlarda hidrojeolojik gözlem kuyuları açılacaktır. Kuyu lokasyonları Proje ünitelerinin iz düşüm alanları dikkate alınarak gerçekleştirilecektir. Kuyuların Proje ünitelerine ait iz düşüm alanlarının sınırında ya da yakınında açılması planlanmaktadır. Böylece Proje'nin inşaat aşamasında kuyuların iptal olmaması ve kuyularda izleme/örnekleme çalışmalarının Proje'nin ilerleyen aşamalarında da devam edebilmesi amaçlanmaktadır. Kuyu lokasyonlarının yanı sıra, kuyu sayısı ve kuyu derinlikleri ünitelerin iz düşüm alanlarına ve topografik koşullara göre belirlenecektir. Maden alanında açılacak kuyu sayısı ve bu kuyuların derinlikleri açık ocak ve yeraltı işletmesinin üç boyutlu tasarımı incelenerek nihai hale getirilecektir.

Kuyularda yapılacak olan yeraltısuyu seviye ölçümleri ve akifer testleri ile litolojilere ait hidrojeolojik özellikler belirlenecek ve Proje alanının hidrojeolojik karakterizasyonu yapılacaktır. Karakterizasyon sonrasında elde edilen bilgiler, daha sonra kurulacak olan

SERBEST MESLEK MENSUBU

yeraltısuyu akım modeline girdi niteliğinde olacaktır. Yeraltısuyu akım modeli ile Proje'den kaynaklanan hidrojeolojik etkilerin değerlendirilmesi sağlanacaktır.

Hidrojeolojik çalışmalara ek olarak, Proje ünitelerinin konumlarına göre, madenciliğin yapılacağı alanlardaki litolojileri temsil edecek bir jeokimyasal karakterizasyon programı oluşturulmuş ve Asit Kaya Drenajı (AKD) ve çevresel jeokimya çalışmaları yapılmaktadır.

Yeraltı Suyu Kaynaklarının Mevcut Kaliteleri

Proje alanı ve yakın çevresinde yer alan yeraltı suyu kaynaklarının mevcut kalitelerinin belirlenmesi amacı ile çevresel veri tabanı çalışmaları kapsamında yerinde ölçüm ve örnekleme çalışmaları gerçekleştirilmiştir. Bu kapsamda, 2021 yılı Mayıs ayında saha çalışmaları yapılarak belirlenen kaynaklarda, yerinde ölçümler yapılmıştır. Belirlenen yeraltı su kalitesi gözlem noktalarında 2021 yılı Mayıs, Ağustos ve Kasım aylarında ve 2024 yılı Mayıs ayında örnekler alınmış ve analizler gerçekleştirilmiştir. ÇED Alanı ve yakın çevresinde yeraltı su kalitesini belirlemek amacıyla seçilen gözlem noktalarına ait bilgiler Tablo Hata! **Belgede belirtilen stilde metne rastlanmadı.**.1'de özetlenmektedir.

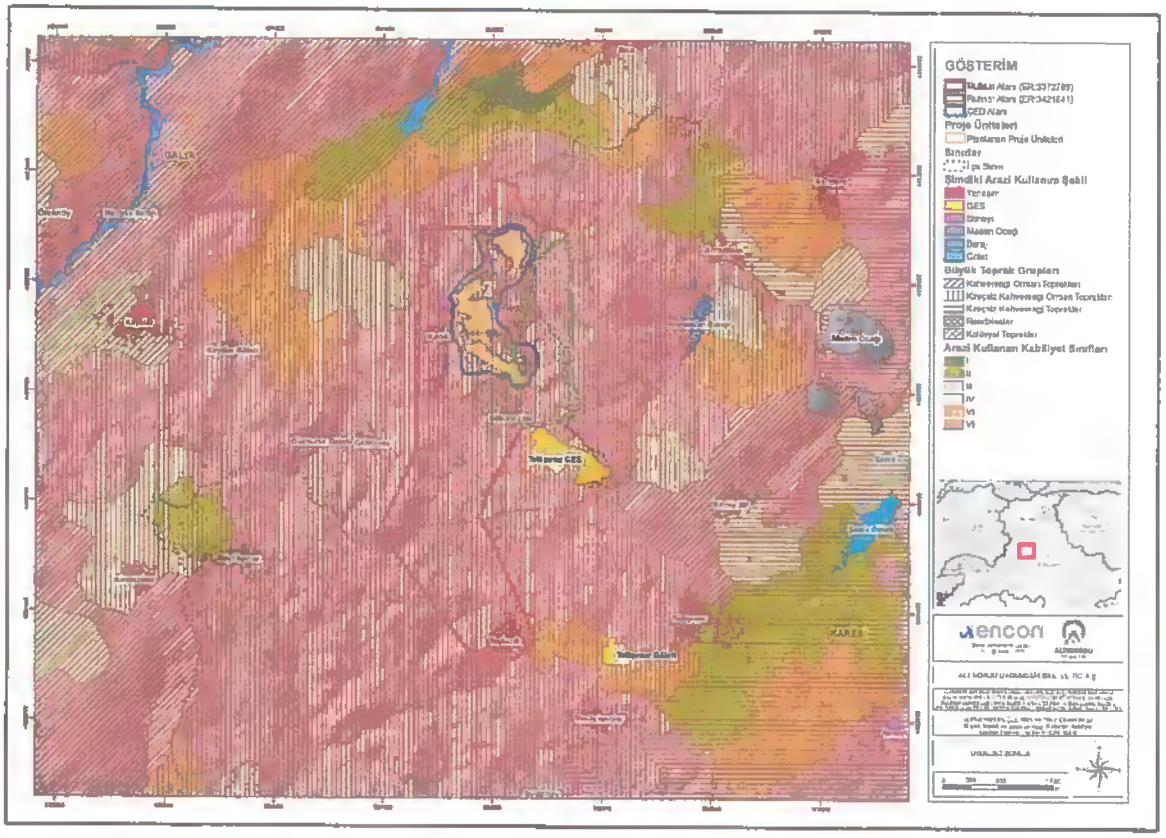
ğ) Toprak durumu.

Projeye ait ruhsat alanları içerisindeki toprak özellikleri, mülga KHGM'ye ait 1999 tarihli arazi kullanımı ve toprak özellikleri haritaları temel alınarak, Coğrafi Bilgi Sistemleri (CBS) aracılığı ile sorgulanması neticesinde değerlendirilmiştir.



Büyük toprak grupları açısından yapılan değerlendirmeye göre, ruhsat alanlarında yer alan temel toprak tipi Kireçsiz Kahverengi Orman Toprakları olup, ruhsat alanlarının %97,54'lük bölümünü kaplamaktadır. Alanın yaklaşık %2,46'lık bir bölümünde ise yerleşimler yer almaktadır.

Kireçsiz Kahverengi Orman Toprakları:
Bu gruptaki topraklar değişik ana kayalardan oluşmuştur. Renk ve baz durumu ana materyal ve organik madde miktarına bağlı olarak değişir. A (B) C profilli topraklardır. A horizonu iyi oluşmuştur ve gözenekli bir yapısı vardır. B horizonunu gözle ayırt etmek zordur. Kahverengi veya koyu kahverengi granüler veya yuvarlak köşeli bir yapıdadır. B horizonunda kil birikimi yok veya çok azdır. Bu horizon birçok kısımlarda yoktur ve A 1'in hemen altında C horizonu bulunmaktadır. Kireçsiz Kahverengi Orman Topraklan genellikle yaprağını döken orman örtüsü altında oluşur

h) Flora, fauna ve lokal endemik türlerin belirlenmesi.

1) Türler, endemik türlerin listesi, yaban hayatı türlerinin listesi ve biyotoplar, ulusal ve uluslararası mevzuatla koruma altına alınan türlerin listesi,

Proje Sahası ve çevresinde yapılan saha çalışmalarında 10 endemik türe rastlanmıştır. Bunlardan 5'i bölgesel yayılışlı olup ülkemizde sadece Balıkesir ve Çanakkale illerinde yayılış göstermektedir. Bunlara ek olarak endemik olmadığı halde nadir yayılışlı olan 4 tür bulunmaktadır.

Balıkesir İlinde toplam ormanlık alanlar 632.405 hektarlık bir alan kaplamaktadır. Bu alanların 435.162 hektarı normal kapalı, 197.243 hektarı ise boşluklu kapalı imar ve ıslaha gerek duyulan ormanlardan oluşmaktadır. İlin ormanlık alan yüzdesi Orman Genel Müdürlüğü 2023 resmi istatiksel verilere göre %43 olarak ifade edilmektedir.

Literatür çalışmasında Flora için Prof. Dr. Tuna Ekim ve arkadaşlarının hazırladığı "Türkiye Bitkileri Kırmızı Kitabı", P.H.DAVIS "Flora of Turkey 1-9", Prof. Dr. Turhan Baytop'un "Türkçe Bitki Adları", Barkman J. ve arkadaşlarının "Kritische Bemerkungen und Vorschlage zur Quantitativen Vegetationanalyse" ve Yıldırım Akman'ın "Türkiye Orman Vejetasyonu"; Fauna için ise, Prof. Dr. Ali Demirsoy'un "Türkiye Omurgalıları Kırmızı Liste Kitabı" ile "Genel Zoocoğrafya ve Türkiye Zoocoğrafyası", Kiziroğlu'nun "Türkiye Kuşları Kırmızı Liste Kitabı" ile "Türkiye Kuşları Cep Kitabı" adlı eserlerden yararlanılmıştır.

İnceleme alanı Grid Kareleme sistemine göre A2 karesinde yer almaktadır. Fitocoğrafya bölgeleri; doğal ortamla ilgili yapılan çalışmalardan yararlanarak, morfolojik, klimatolojik, paleoklimatolojik, anamateryal ve toprak şartlarının belirlediği kendi içerisinde benzer özelliklere sahip, farklı yetişme muhitleri olarak ayırt edilmektedir. Anadolu, fitocoğrafya bölgeleri itibariyle; Avrupa-Sibirya (Karadeniz), İran-Turan (İç, Doğu ve Güneydoğu Anadolu Bölgeleri) ve Akdeniz (Ege, Akdeniz Bölgeleri) Fitocoğrafya bölgeleri olmak üzere üç ana gruba ayrılmaktadırlar.

Alanda yapılan arazi gözlemleri ve literatüre göre çalışma alanının Avrupa-Sibirya Floristik Bölgesi'nin Öksin alt bölgesine dahil olduğu gözlenmiştir. Ancak bölgede Akdeniz ve İran-Turan Fitocoğrafik bölgesi elemanlarına da rastlanılmaktadır. Bu floristik bölgenin genel özellikleri ve önemli bitki listeleri ise aşağıda verilmiştir.

- Avrupa-Sibirya Fitocoğrafik Bölgesinin Sınırları ve Genel Özellikleri

Yörenin, Akdeniz fitocoğrafik bölgesinin etkisi altında kaldığı görülmektedir. Bu bölge iklimsel görüş açısından, Karadeniz hariç yurdumuzun diğer bölgeleriyle benzerlik gösterir. Zira Karadenizin dışında, yurdumuzun tamamında yaz kuraklığı karakteristiktir. Bu özellik Akdeniz iklim tipinin karakteristiği olup, bölgenin tamamı homojen bir iklim tipine sahip değildir. Bu nedenle de bitki örtüsü çeşitlilik göstermektedir.

2) Nadir ve nesli tehlikeye düşmüş türlerin listesi ve bunların yaşama ortamları, bunlar için belirlenen koruma kararları,

Proje sahasında yapılan çalışmalar neticesinde nadir yayılışlı ve uluslararası tehlike kategorilerinde bulunan türler gözlemlenmiştir. Bu türler için belirlenen koruma alanlarına rastlanmamıştır.

3) Yaban hayvanları ve bunların popülasyonu ile yaşama ortamları.

Proje sahasında *Lepus europaeus* – Yabani tavşan, *Erinaceus concolor* – Kirpi, *Vulpes vulpes* – Kızıl tilki, *Testudo graeca* – Tosbağa, *Hyla orientalis* – Ağaç kurbağası gibi türlere rastlanılabilmektedir.

ı) Meteorolojik özellikler.

Balıkesir il sınırları içerisinde bulunan büyük ve küçük klima istasyonlarının yıllık yağış miktarları ile yıllık ortalama sıcaklıkları esas alınarak Koppen'e göre iklim tasnifi yapılmış ve tüm istasyonların ortak iklimler kuşağına dahil olduğu tespit edilmiştir. Balıkesir il sınırları içerisindeki tüm istasyonların kuruluşundan 2024 yılına kadar olan Meteorolojik kayıtları incelenmiş ve ilin genel iklim durumu ortaya çıkarılmıştır. Balıkesir Akdeniz iklimi ile Karadeniz iklimi arasındaki geçiş bölgesinde bulunmaktadır.

T.C.
Marat BİLGEN
Orman Mühendisi

SERBEST MESLEK MENSUBU

Bu nedenle her iki iklimin özelliklerini yer yer görmek mümkündür. Ege kıyılarında bulunan istasyonlarda yazları sıcak ve kurak, kışları ılık ve genellikle yağışlı Akdeniz iklimi görülmektedir. Marmara kıyılarında ise Karadeniz ikliminin etkisiyle yazlar nispeten serin geçmektedir. Kıyılardan iç kesimlere doğru gidildikçe iklim karasallık eğilimi göstermekte ve kışlar soğuk geçmektedir.

Genel olarak Kuzeyden esen rüzgarların hakimiyeti altındadır. Ancak yıl içerisinde hava ve mevsimlere göre farklılıklar gösterir.

Kış aylarından aralıkta kuzey ve Kuzeybatı öbür aylar ise güney ve güneybatı yönlü esmektedirler.

Yıllık sıcaklık ortalaması 12,8 °C'dir. Ortalama en sıcak ay Temmuz ve Ağustos 22,2 °C, en soğuk ay Ocak 3,4 °C'dir. Yıllık maksimum sıcaklık değeri 40,9 °C ile Temmuz, minimum sıcaklık değeri – 11,4 °C ile Ocak ayında görülmüştür. Özellikle yaz aylarında kuzeyli rüzgarların ve yüksek sıcaklığın etkisiyle buharlaşma meydan gelmektedir. Balıkesir'de son 20 yılda en fazla yağış Ocak ayında görülmüştür. İlin yıllık yağış toplamı 663,2 mm/m² dir.

Balıkesir/Akçaldede Radar Sahası (2005 - 2024)	OCAK	ŞUBAT	MART	NİSAN	MAYIS	HAZİRAN	TEMMUZ	AĞUSTOS	EYLÜL	EKİM	KASIM	ARALIK	YILLIK

(3) Faaliyet esnasında ve sonrasında yapılacak çalışmalar:

a) Faaliyet esnasında oluşabilecek etkilere karşı alınacak önlemler

1) Korunması gereken toprak ile ilgili yapılacak işlemler. (Verimli toprağın kaybını en aza indirecek sıyırma tekniği, depolanacak alanın tesviye edilmesi, eğimin 1/3 olması, drenaj kanalı açılması, taşınması, izin verilecek alanda depolanması, korunması, tel çit çekilmesi ve levha konulması)

Verimli toprak üretime başlamadan önce üst ve alt toprak olarak ağaç köklerinin yayıldığı toprağın (fizyolojik derinliğin) tamamı arazi meyli ve arazi kotu dikkate alınarak ekskavatör ve yükleyici yardımıyla yukarıdan aşağıya doğru sıyrılarak Verimli

T.C.

toprak depolama alanına depolanacaktır. Depolanan verimli toprağın biyolojik aktivitesini kaybetmemesi için gerekli önlemler alınacaktır. Bu işlem üretime geçmeden önce malzeme alınacak alanın temizlenmesi şeklinde yapılmakta olup, faaliyet süresince devam edecektir.

Toprak depolama alanlarında oluşturulan şevlerin stabilizesini ve araçlarla makinelerin kolayca manevra yapabilmelerini sağlamak için şev eğimlerinin azami 1/3 olacak şekilde düzenlenecek, basamaklarının genişliğinin en az 10 metre olacak şekilde planlanacaktır. Toprağın sıkışmasını önlemek maksadıyla toprak depolama alanında yüzey düzeltmeleri ağır olmayan paletli veya tekerlekli araçlar ile yapılacaktır. Bu alanlara toprak dışında, pasa, evsel atık, tıbbi atık, inşaat, yıkıntı, hafriyat atıkları dökülmeyecektir. Toprak depolama alanının kaybolmaması için, alan etrafına drenaj kanalı açılacak ve yeteri miktarda açıklayıcı tabelanın alanın görülebilecek noktalarına konulması sağlanacaktır. Tabelalar 100 cm x 150 cm boyutlarında ve beyaz zemin üzerine kırmızı harflerle yazılmış olup sağlam bir şekilde zemine sabitlenecektir. Toprak depolama alanında oluşturulan yamaçlarda veya basamaklarda yağış suları ile taşınma ve yarıntıların oluşmaması, kayma ve göçmelerin engellenmesi maksadıyla toprak tamamen nakledildikten sonra toprağı tutucu bitki ekimi ve dikimi yapılacak, yüzeyin bitkilendirilmesi ve köklerle kaplanması sağlanacaktır.

2) Rehabiliteye konu izin talep alanının sınırlandırılması ve uyarı-tanıtım levhalarının uygun yerlere yerleştirilmesi:

İşletme, Tesis ve altyapı tesis alanının etrafına, sahaya dışarıdan girilmesi halinde tehlikeli olacağını belirten ikaz levhaları konulacak, saha etrafı gerekli olan korumaya alınacak, dışarıdan girişler engellenecektir. Çalışanların bu konularda eğitimleri sağlanacaktır.

3) Şevler, basamaklar, ocak çukurları, yeraltı ocağı giriş ve çıkışları, tasmanlar ile ilgili yapılacak işlemler ve alınacak güvenlik önlemleri:

Basamak genişliği 5 m, basamak yüksekliği 10 m olarak planlanmıştır. Uygulamada Madencilik yönetmeliği ve madencilik faaliyeti ile bozulan arazilerin doğaya yeniden kazandırılması yönetmeliği ve işletme projesine uyumlu olarak çalışma yapılacak olup şev stabilitesini sağlamak amacı ile şev açısı 70° 'yi geçmeyecektir. Üretim alanında oluşan şevlerde kavlak ve düşme tehlikesi olan taş bırakılmayacaktır. Ocak üretim alanında çukur oluşturulmayacak ve su birikmesine karşı gerekli drenaj alt yapısı oluşturulacaktır.

4) Pasa döküm alanı, atık barajı, liç, atık kazanma ve atık bertaraf tesisi vb. yerlerle ilgili işlemler ve alınacak güvenlik önlemleri:

İşletme projesi ve Çevre Şehircilik ve İklim Değişikliği Bakanlığına sunulan atık yönetim planı ile uyumlu olacak. Pasa, atık sahaları ve üst toprak depolama alanları çevresinde uyarı -ikaz levhaları konulacak ve gereksiz girişlerin önlenmesi için saha etrafı korumaya alınacaktır.

OMO Sicil No: 13186
SERBEST MESLEK MENSUBU

b) **Rehabilitasyona konu alanların madencilik faaliyetine kapandıktan sonra olabilecek, süren etkiler ve bu etkilere karşı alınacak önlemler**

1) Maden işletme alanında oluşturulan boşlukların ve kazı alanlarının rehabilitesi:

Oluşabilecek boşluklar önceden depolanmış dekapaj ile doldurulacaktır. Şev ve basamaklar madencilik yönetmeliği ve madencilik faaliyeti ile bozulan arazilerin doğaya yeniden kazandırılması yönetmeliğine uygun şekilde düzenlenecektir.

2) Pasa döküm alanı, atık barajı, liç, atık kazanma ve atık bertaraf tesisi vb. sahalarda Maden atık yönetmeliği kapsamında Çevre Şehircilik ve İklim Değişikliği Bakanlığı yetkisinde olan denetim ve planlama işlemlerine ait atık yönetim planı bilgisi:

Döküm harmanlarının şev ve basamakları madencilik yönetmeliği ve madencilik faaliyeti ile bozulan arazilerin doğaya yeniden kazandırılması yönetmeliğine uygun şekilde düzenlenecektir. Çevre Şehircilik ve İklim Değişikliği Bakanlığı Atık yönetim planına uyulacaktır.

3) Olası erozyona karşı gerekli önlemlerin alınması: Basamakların ve pasa döküm alanlarındaki stabiliteyi bozacak etkilere karşı drenaj vb. önlemlerin alınması:

Sahada ortalama meyil 2-6 arasındadır. Sahada erozyon söz konusu olmayacaktır. Bu nedenle erozyon tedbiri alınmasına gerek bulunmamaktadır. Pasa ve depolama alanlarındaki stabiliteyi bozabilecek akışlara karşı drenaj hendeği açılacaktır.

4) Yeniden düzenlenen alanlara depolanan verimli toprağın serilmesi ile habitat oluşumuna uygun hale getirilmesi:

Üst toprak alanında depolanmış olan nebati toprak makine ve insan gücü ile uygun şekilde serilerek doğaya uyumlu hale getirilecektir.

5) Faaliyet sonrası rehabilite edilen alanlardaki ekolojik değişimin takibi ile emniyet ve güvenlik amacıyla sahanın gözlem araçlarıyla izlenmesi:

Ruhsat sahibi 3 (üç) yıl süreyle Rehabilite edilen alandan sorumlu olacaktır.

(4) Karbon bilançosunun hesap edilmesi: İzin verilen sahada örtünün kaldırılması sonucu oluşacak karbon miktarı kaybı ile yapılacak rehabilitasyon çalışmaları sonucunda elde edilecek karbon kazanımı

Karbon Hesap Tablosu ekte sunulmuştur.

MESLEK MENSUBU

(5) Rehabilite çalışması çerçevesinde yapılacak çalışmalar için uygulama takviminin hazırlanması. (Faaliyet esnasında ve sonrasında yapılacak çalışmalar ile ilgili iş akış planlamasının cetvel halinde hazırlanması, görsel araçlarla aşamaların arşive edilmesi)

a) Faaliyet alanını düzenleme: Atık, artıkların bertarafı ve düzenlenmesi, servis alanlarının kaldırılması: 2 ay

b) Faaliyet sahasının doğaya uygun hale getirilmesi: Çalışma sırasında en az kayıpla üst toprağın sıyrılması sonucu depolanan üst toprağın dekapajla doldurulan alanlara serilmesi oluşabilecek boşlukların doldurulması, çalışma alanlarının tesviyesi, bozulan topoğrafyanın morfolojik duyarlılığının sağlanması: 3 ay

c) Arazi duraylılığının sağlanması: Şev açılarının yönetmeliğe uygun hale getirilmesi: 2 ay

d) Arazinin doğaya uygun hale getirilmesi için gerekli ortamın hazırlanması: 2 ay

e) Faaliyet alanlarının kapatılması ve Orman işletmesine teslim edilmesi: Orman işletmesi ile gerekli istişarenin yapılarak görülen eksikliklerin giderilmesi ve idareye teslime hazır hale getirilmesi: 2 ay

202201688 RUHSAT NUMARALI İZİN ALANI İÇİN TOPLAM KARBON STOK MİKTARININ HESAPLANMASI VE GRAFİK OLARAK GÖSTERİLMESİ

AĞAÇ TÜRÜ GRUPLARI		ORMAN ALANI (ha)	DGH (m3)	KARBON HAVUZLARI								PLAN ÜNİTESİ GENEL TOPLAMI
				Toprak Üstü Canlı Biyokütle	Toprak Altı Biyokütle	Toprak Üstü Canlı Biyokütle Karbon Miktarı 1	Toprak Altı Biyokütle Karbon Miktarı 2	Toplan Canlı Biyokütle Karbon Miktarı	Ölü Odun Karbon Miktarı 3	Ölü Örtü İçindeki Karbon Miktarı 4	Toprak İçindeki Organik Karbon Miktarı 5	
				(TÜB=DGH x FKAxBGF)	(TAB=TÜBxR)	(TÜK= TÜB x CF)	(TAK=TAB x CF)	(TÜK+TAK)	ÖOK =TÜB x 0,01 x 0,47	ÖÖK=Alan x F	OTK=Alan x S	
				(Ton)	(Ton)	(Ton)	(Ton)	(Ton)	(Ton)	(Ton)	(Ton)	(Ton)
VERİMLİ ORMAN	Yapraklı	0.5	16.932	12	3	6	1	7	0	2	43	52
	İbreli	2.4	63.549	34	10	18	5	23	0	18	186	227
	TOPLAM		80.481	46	13	23	6	30	0	20	229	279
BOZUK ORMAN	Yapraklı	0.0	6.000	4	2	2	1	3	0	0	1	4
	İbreli	3.3	8.000	4	2	2	1	3	0	6	62	71
	TOPLAM		14.000	9	4	4	2	6	0	6	63	75
GENEL TOPLAM		**6**	**94**	**55**	**17**	**28**	**8**	**36**	**0**	**26**	**291**	**354**

1.Aşama; a) Toprak üstü canlı biyokütle (ton), **TÜB=DGH x FKA x BGF**

DGH = Her ağaç türü ya da ağaç türü gurubu için toplam dikili kabuklu gövde hacmini (m^3),

FKA = Her tür ya da tür grubu için daha önce saptanan (Yapraklılar için 0,541 t/m^3 iğne yapraklılar için 0,446 t/m^3) taze gövde odunu hacminin fırın kurusu ağırlığı (t/m^3),

BGF = Her ağaç türü ya da ağaç türü gurubu için dikili kabuklu gövde hacmine karşılık gelen biokütleyi toprak üstü toplam biokütleye genişletmek için (yapraklılarda **1,31** İğne yapraklılarda **1,212**) kullanılan genişletme faktörleridir.

b) Toprak altı canlı biyokütle (ton), **TAB=TÜB xR**

R = Kök/Sak oranı: Ağacın toprak üstü bitkisel kütlesini kökler dahil tüm ağaca dönüştürme katsayısıdır. Kök/Sak oranı (R) için FRA-2010 kılavuzundan Türkiye'nin bulunduğu iklim kuşağı ve ormanlarda bulunan ortalama servet dikkate alınarak;

R=Yapraklı Verimli ormanlar için= **0,24** R=İbreli Verimli ormanlar için= **0,29** R=Yapraklı Bozuk ormanlar için= **0,46** R=İbreli Bozuk ormanlar için= **0,40**

2.Aşama; Toprak Üstü Karbon Miktarı; **TÜK=TÜB x CF** ve Toprak Altı Karbon Miktarı; **TAK= TAB x CF**

CF = Yapraklı ormanlar için karbon miktarına dönüştürme faktörü **(0,48)**, CF = İbreli ormanlar için karbon miktarına dönüştürme faktörü **(0,51)**,

3.Aşama; Ölü Odun Karbon Miktarı; **ÖOK=TÜB x 0,01 x 0,47 (Ölü odun içindeki karbon miktarını hesaplamak için FRA (2010) kılavuzuna göre karbon dönüştürme faktörü (CF) 0,47 olarak alınmaktadır)** (dikili kuru ve devrik ağaçlar için TÜB nin % 1 i kabul edilmiştir.

4. Aşama; Ölü Örtü İçindeki Karbon Miktarı; **ÖÖK=Alan x F** Tolunay ve Çömez (2008)'in yaptığı çalışmalara göre Türkiye için F değerleri;

F1;İbreli Verimli ormanlar için; 7,5 ton/ha F2; Yapraklı Verimli ormanlar için; 3,8 ton/ha F3; İbreli Bozuk ormanlar için; 1,9 ton/ha Yapraklı Bozuk ormanlar için; 1 ton/ha

5.Aşama; OTK = Alan x S Toprak İçindeki Organik Karbon Miktarı; Tolunay ve Çömez (2008)'in yaptığı çalışmalara göre Türkiye'deki orman topraklarında birim alandaki ordanik karbon stokları için S1;İbreli Verimli ormanlar için; 77 ton/ha S2; Yapraklı Verimli ormanlar için; 85 ton/ha S3;İbreli Boşluklu Kapalı ormanlar için; 19 ton/ha S4; Yapraklı Boşluklu Kapalı ormanlar için; 21 ton/ha

KISALTMALAR VE SEMBOLLER

Aşağıdaki liste, metin boyunca kullanılan sembollerin listesidir. Ayrıca, çoğu sembol eğer kullanımı aşağıdakilerden farklı ise kullanıldıkları yerde veya ilk defa kullanıldıklarında tanımlanmaktadır

a : Hoek & Brown katsayısı

mi: Hoek Brown Malzeme Sabiti

mb: Hoek&Brown Blok Malzeme Sabiti

s: Hoek&Brown Süreksizlik Katsayısı

c : Kohezyon

D: Örselenme Faktörü

Ei: Sağlam Kaya Elastisite Modülü

Em: Kaya Kütlesi ElastisiteModülü

GSI: Jeolojik Dayanım İndisi

γ : Doğal Birim Hacim Ağırlık

Lu: Lugeon

V: Poisso oranı

Φ: İçsel sürtünme açısı

RQD: Kaya Kalite Değeri

UCS: Tek Eksenli Basınç Dayanımı

1. GİRİŞ

1.1. İncelemenin Amacı ve Kapsamı

Altınordu Madencilik tarafından işletilecek olan Balıkesir-Karlık Altın-Gümüş Madeni Sahası için planlanan tesislerin temel altı ve çevresinde bulunan doğal birimlerin yapısal ve jeoteknik özelliklerini aydınlatmak için Şubat-Nisan 2025 tarihinde yapılan literatür, saha ve laboratuvar çalışmalarının derlenip amaca uygun olarak Jeolojik-Jeoteknik Rapor hazırlanmıştır.

1.2. İnceleme Alanının Yeri ve Ulaşım

Çalışma alanı Marmara bölgesinde Balıkesir İli, Balya İlçesi'nde bulunmakta olup yaklaşık 195-320 m yükseltiye sahiptir. Ilıca, Balya yolu ile ulaşım sağlanmaktadır yol asfalt olup her mevsim ulaşım mümkündür. Balıkesir 1/25000 I 19 a3 ve I 19 b4 paftalarında bulunmaktadır. İnceleme alanı Şekil1'de gösterilmiştir.

Şekil 1 Çalışma sahası

1.2.1. Veriler ve Çalışma Yöntemi

Proje kapsamında 1/25000 ölçekte haritalardan yararlanılmış ardından yerinde gözlem ve örnekleme ile çalışma finale ulaştırılmıştır.

2. ÖNCEKİ ÇALIŞMALAR

İnceleme alanında MTA tarafından hazırlanmış 1/100000 ve 1/25000 ölçekte haritalardan yararlanılmıştır.

3. GENEL JEOLOJİ

Genel Jeoloji çalışmalarında Altınordu Madencilik tarafından yürütülmüş olan detaylı çalışmalar referans alınmıştır.

3.1.Stratigrafi

Çalışma alanı tabanında Alt Triyas yaşlı (Akyürek ve Soysal, 1989) ardalanmalı metakumtaşı-metaçakıltaşı ve metaçamurtaşından oluşan metamorfik/metasedimanter (MSed) seri yer almaktadır. Kıvrımlı olarak gözlenen bu seri, yataya yakın konumlanmış Alt-Orta Triyas yaşlı (Akyüz, S ve Okay, A., 1998) çamurtaşı klastları içeren kumtaşı-kuvars kumtaşı (Ssa) - çamurtaşı (Sms) ve çakıltaşından (Scs) oluşan klastik seri tarafından uyumsuzlukla örtülmektedir. Oligo-Miyosen yaşlı (Koç vd., 1994; Duru vd., 2004) otobreş ve akma bantları gözlenen feldspar + biotit ± kuvars feldspar phyric asidik dasit-andezitik volkanikler (VIA-1/VIA-2), metasedimanter ve klastik serileri uyumsuzlukla üzerler ve tüm birimler Oligo-Miyosen yaşlı (Koç vd., 1994; Duru vd., 2004) ortaç/felsik nitelikli multifaz feldspar - biotit ± hornblend (SIA1) ve kuvars – feldspar porfiriden (QFP) oluşan subvolkanikler tarafından kesilir (Şekil 2).

Batı Anadolu' nun tektonik yapısının şekillenmesinde Avrasya, Afrika, Arap, Ege, Ege-Anadolu ve Karadeniz levhaları arasındaki göreceli hareketler etkili olmuştur. Afrika ve Arap levhalarının Avrasya levhasına göre kuzeye doğru hareket etmesi, Anadolu levhalarının batıya hareket etmesine neden olmaktadır. Balıkesir ve yakın çevresini de içine alan Batı Anadolu, Afrika levhasının Girit adasının güneyinde Ege ile Anadolu levhalarının altına dalması sonucu KKB-GGD yönlü çekme ve gerilmeye uğramıştır (Adatepe, 1998).

Çalışma alanı içerisinde de subvolkanikler ile sedimanter ve volkanik birimlerin kontağında bu çekme-gerilme kuvvetleri etkisiyle oluşmuş, DB ve BKB-DGD doğrultulu yaklaşık 70 ~ 80 derece güney/güneybatıya eğimli normal faylar ile bu fay zonunu kullanan sonradan yerleşmiş multifaz epitermal kuvars damarları ve tüm bunları kesen KG ve KKD doğrultulu dextral? eğim atımlı genç faylar ve horst graben yapıları mevcuttur. Özellikle horst graben yapılarındaki korunmuş bölgeler ve birbibini kesen yapıların kesiştiği alanlar yüksek potansiyelli zonlar oluşturmaktadır (Şekil 3).

BKB-DGD yapı boyunca litolojik birimler üç ana alana ayrılmıştır.

- Birinci domain; tavan blogu grubu;

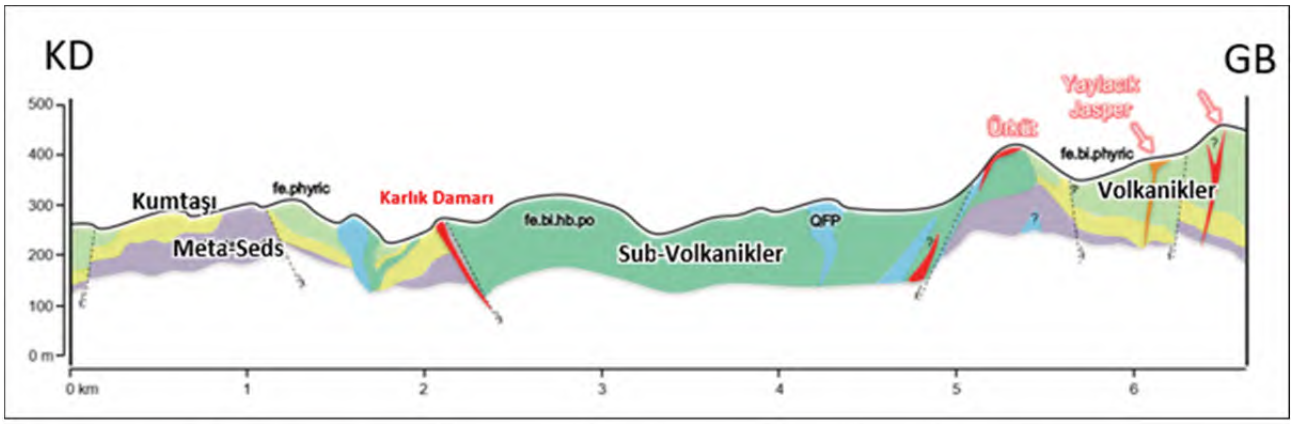
Feldspar - biotit ± hornblend Porfiri (SIA1), Volkanik Breş (XBX.po) ve Dayklar (IDYK)

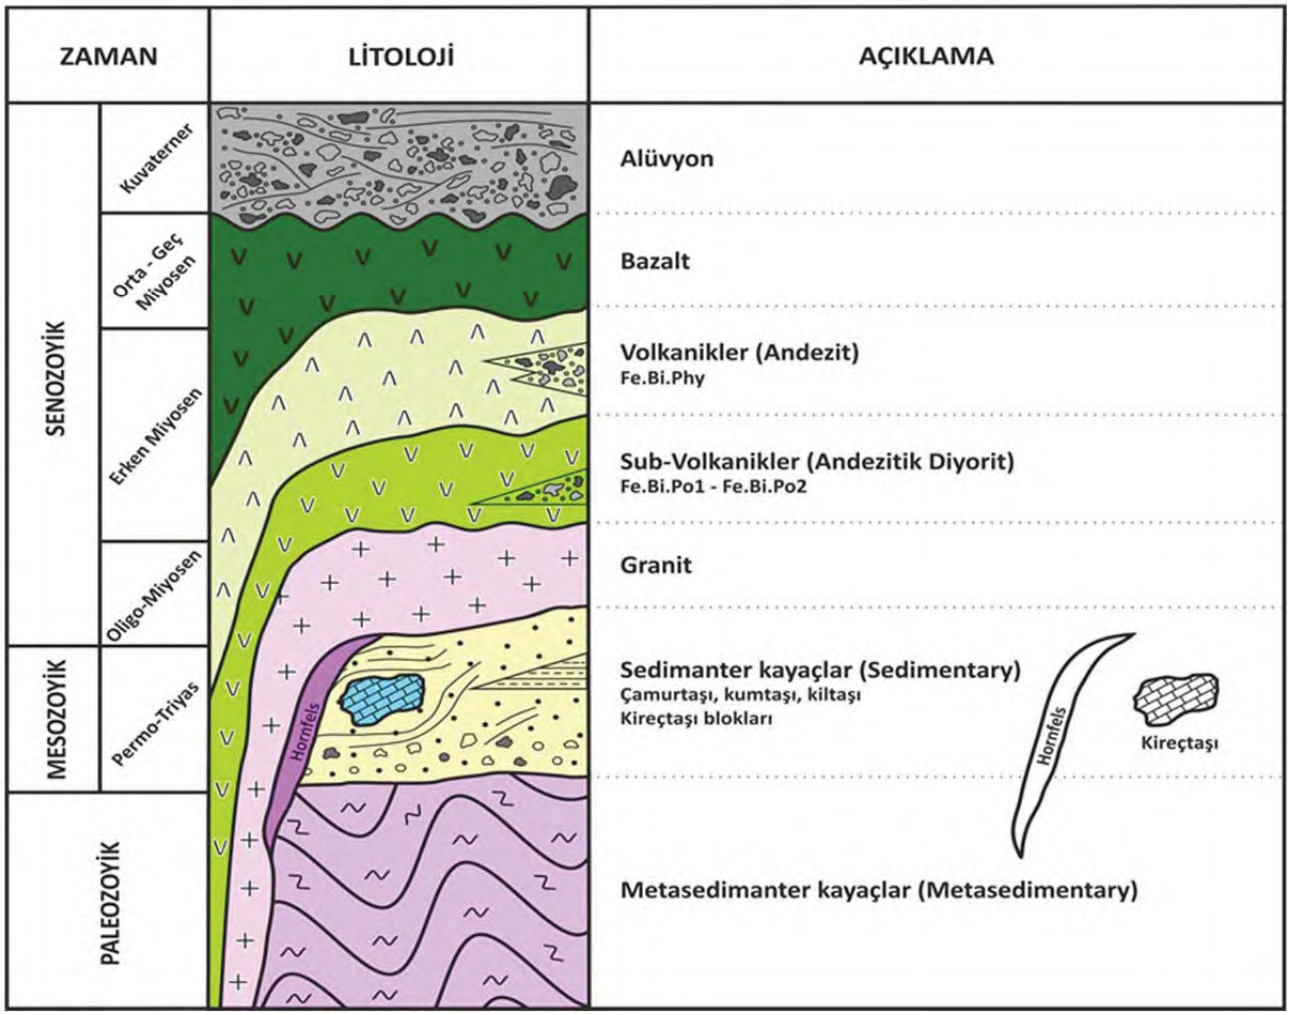
- İkinci domain; BKB-DGD doğrultulu yapı boyunca yerleşmiş kuvarslı-silikalı yapılar;

Fay Grubu (FLT-FLt1-FLT2), QV1-QBX, QV2 ve HBX iken;

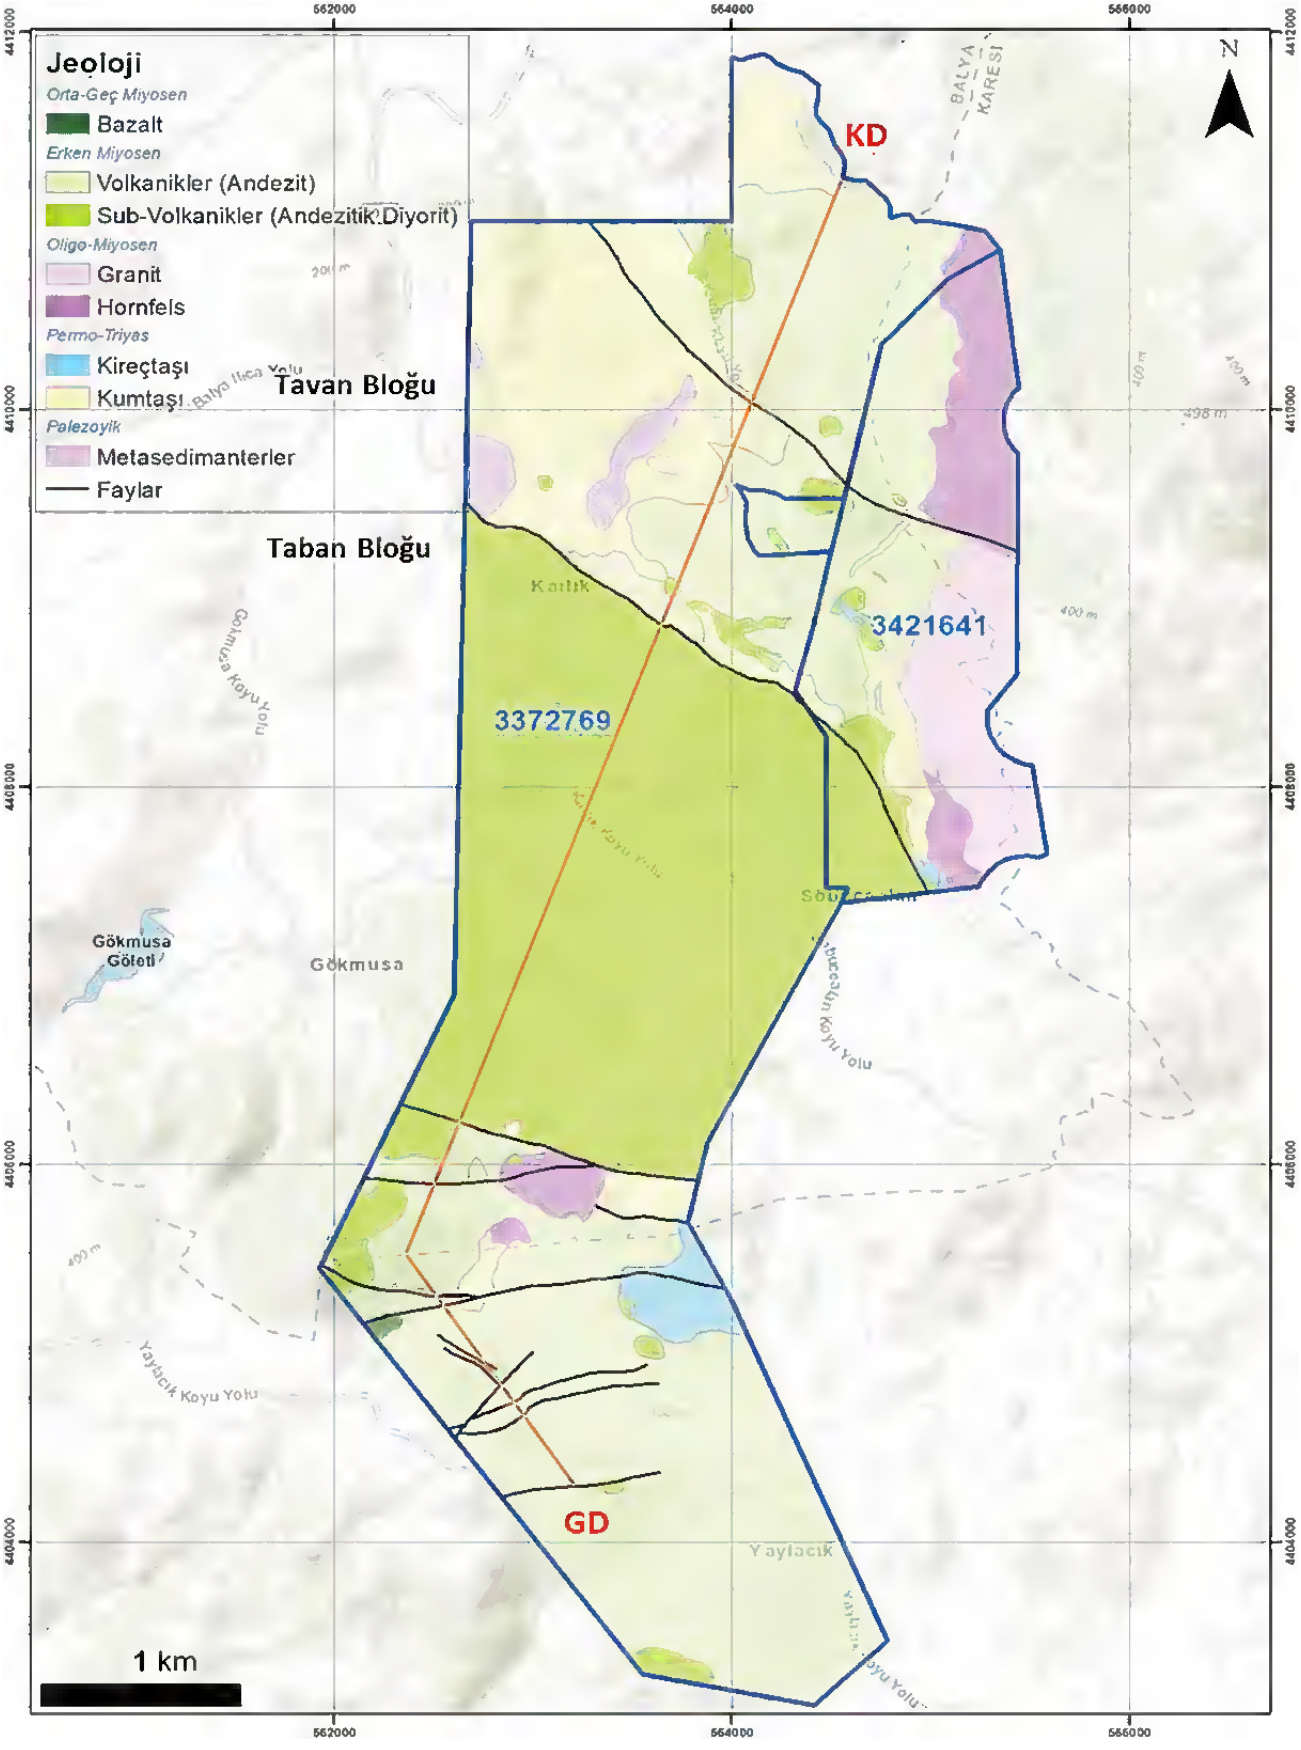
- Üçüncü domain; taban bloğu grubu;

Sedimanterler (Ssa) ile Metasedimanlar (MSed) ve andezitik volkanikler (VIA1) ile feldspar ± kuvars porfiri **(SIA2)** birimi yer almaktadır.





Şekil 2 Çalışma alanına ait enine jeolojik kesit ve teorik kolon kesit



Şekil 3 Çalışma alanına ait jeoloji haritası

3.1.1. Tavan Bloğu

3.1.1.1. Sia1 – Subvolkanik Andezit 1

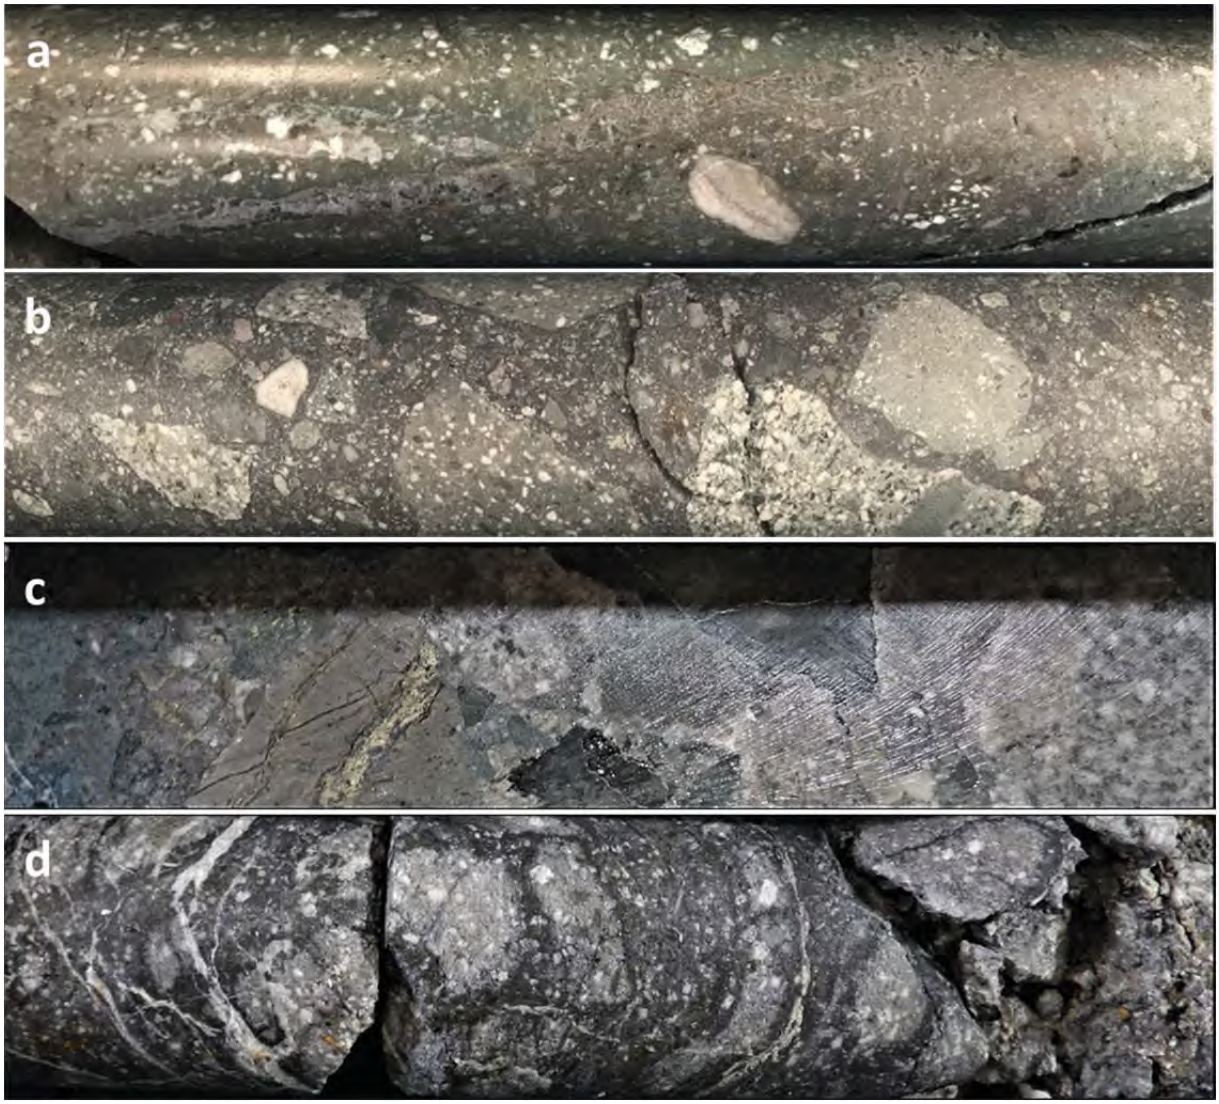
BKB-DGD doğrultulu yapının tavan bloğunda yer alan, kalk-alkali ortaç/felsik nitelikli feldspar - biotit ± hornblend ve kuvars – feldspar porfirilerden oluşan, taze yüzeyi yeşil ve pembe tonlarında kalabalık dokulu groundmass baskın, 1 cm' e kadar feldspar ve hornblend fenokristalleri ve 5 cm' e kadar mafik anklavlar feldspar- verilen addır. Genel olarak proplitik (chl>ep) altere olarak gözlenen bu birimde, kuvars damarına doğru gidildikçe artan ağsı kuvars-kuvars karbonat damarları Au-Ag' ce zengin anomali vermektedir. Bu birim Xbx.po tarafından kesilmektedir. Arge Test' in gerçekleştirdiği (1 adet) ince kesit çalışmalarına göre, feldspar - biotit ± hornblend porfiri (SIA1) birimi, ince taneli kuvars, serizit, feldspar ve alterasyona bağlı gelişmiş kil mineralleri karışımından oluşmaktadır. Çoğunlukla andezitin ve daha düşük oranlarda sanidin bileşimindeki feldspar fenokristal oluşumları, yer yer kalsit ± serizit ve kuvars gibi ikincil minrallerle doldurulmuştur. Kısmen demir oksit sıvamaları içeren mafik fenokristaller, serizit ± kuvars ve kil gibi yarı opak minerallerce doldurulmuş ve kristal şekillerinden yaralanılarak biyotit ve amfibol olarak yorumlanmışlardır. Ayrıca, kayacın kalsit ± kuvars içeren damar damarcıklar tarafından kesildiği bildirilmiştir (Şekil 4).

Şekil 4 a)KDH20-003 nolu kuyuda gözlenen proplitik altere Felspar Porfiri b)KDH20-009 nolu kuyuda gözlenen stokvörk kuvars-oksit damarları tarafından kesilen Feldspar Porfiri c) KDH20-058 nolu kuyuda gözlenen mafik anklavlar içeren Felspar-Biotit-Hornblend Porfiri

3.1.1.2.Xbx.Po (Subvolkanik Andezit – Altbirimi)

Mafik-afanitik dokulu volkanik ve ortaç andezitik matriks destekli köşeli-yarı köşeli polimiktik çoğunlukla Sia1 olmak üzere, Via1, Sms-Msed ve juvenil? klastlar içeren volkanik breş olarak tanımlanmaktadır. BKB yapının tavan bloğunda gözlenen Sia1'i keserek yerleşen genellikle faylı kontaklar sunan bu birimin porfiritik bir mineralizasyon ile ilişkili klastlar taşıdığı bilinmektedir (KDH20-059). Arge Test' in yaptığı (1 adet) ince kesit çalışmalarında, volkanik breş (Xbx.po) klastlarının kısmen ve ya tamemen altere, feldspar ve mafik mineral fenokristalleri ile daha az oranlarda mono / polikristalen kuvars lensleri içerdiği ve bazı klastların, mikrokristalen kuvars ± serizit çimento ile çevrelendiği ve çoğu feldspar fenokritallerinin, tamamen serizit ve kil altere ve ya ikincil kalsit minerali ile doldurulduğu bildirilmiştir. Fakat, bazı plajiyoklas ve sanidin feldspar kalıntıları tespit edilmiş, mafik fenokristallerin tamamen ince taneli, serizit ± kuvars ve kil gibi saydam minerallerle doldurulduğu ve bu fenokristallerde kısmen demir oksit sıvamaları olduğu bildirilmiştir. Kristal şekillerinden yararlanılarak, mafik fenokristaller biotit ve amfibol olarak yorumlanmıştır.

Koyu renkli ana kütlenin, dissemine öz ve yarı özşekilli pirit içeren kuvars jelden oluştuğu, çatlaklar ve boşlukların, geç evre mikro / mezokristalen kalsit damarcıklarıyla doldurulduğu belirtilmiş ve koyu renkli kuvars jelin volkanik kayaçlara sokularak, onları parçalara ayırdığı ve boşlukları doldurarak breşleştirdiği yorumunda bulunmuşlardır. (Şekil 5).



Şekil 5 a)KDH20-059a nolu kuyuda gözlenen SIA-1 nolu birimi keserek yerleşmiş XBX.po (volkanik breş) b)KDH19-006 nolu kuyuda gözlenen XBX.po birimimine ait genel görünüm c) KDH20-059 nolu kuyuda gözlenen porfiri bir cevherleşmeyle ilişkili olabilecek, manyetit

3.1.1.3.IDYK (Subvolkanik Andezit Alt Birimi)

Yapının tavan bloğunda, özellikle ormanda derin kuyularda gözlenen pembe renkli bu birim andezitik bileşenli feldsparları nispeten belirgin ince taneli ortaç dayk olarak tanımlanmıştır. Sia1'i keserek yerleşmiş bu dayk (faylı kontak), XBX.po tarafından kesilmektedir (Şekil 6).

Şekil 6 a-b)KDH20-034 nolu kuyuda gözlenen ametistli saccaroidal süt kuvars ve pirit damarcıkları tarafından kesilen(IDYK) ortaç ince taneli dayk genel görünümleri c)KDH20-062 SIA-1 klastları içeren mafik afanitik matriksli Xbx.po ve kalsedonik kuvars damarlar.

3.1.2. Cevher Zonu Kuvars Damarı

Derin kuyularda gözlenen bu birim, Qbx ile kontağında gelişen Flt2 ile karakteristiktir. Yer yer breşik zonlar da içeren bu birimde kaynamayı temsil eden yoğun krustiform-kolloform bantlı dokular ve bıçak sırtı dokuları ile ginguro damarları yaygındır. Bu birimin kalınlığı 30 cm ile 3 metre arasında değişmekte ve Au-Ag anomalisi açısından en yüksek değerleri vermektedir (Şekil 7).

Şekil 7 Qv1 birimine ait a)KDH20-58 nolu kuyuda gözlenen makazitli ginguro damarı b)KDH20-058 nolu kuyuda gözlenen parallel bladed dokusu c-d)KDH20-073a ve 058 nolu kuyularda gözlenen lattice bladed dokusu e) KDH20-011 nolu kuyuda gözlenen ginguro-gri silika v

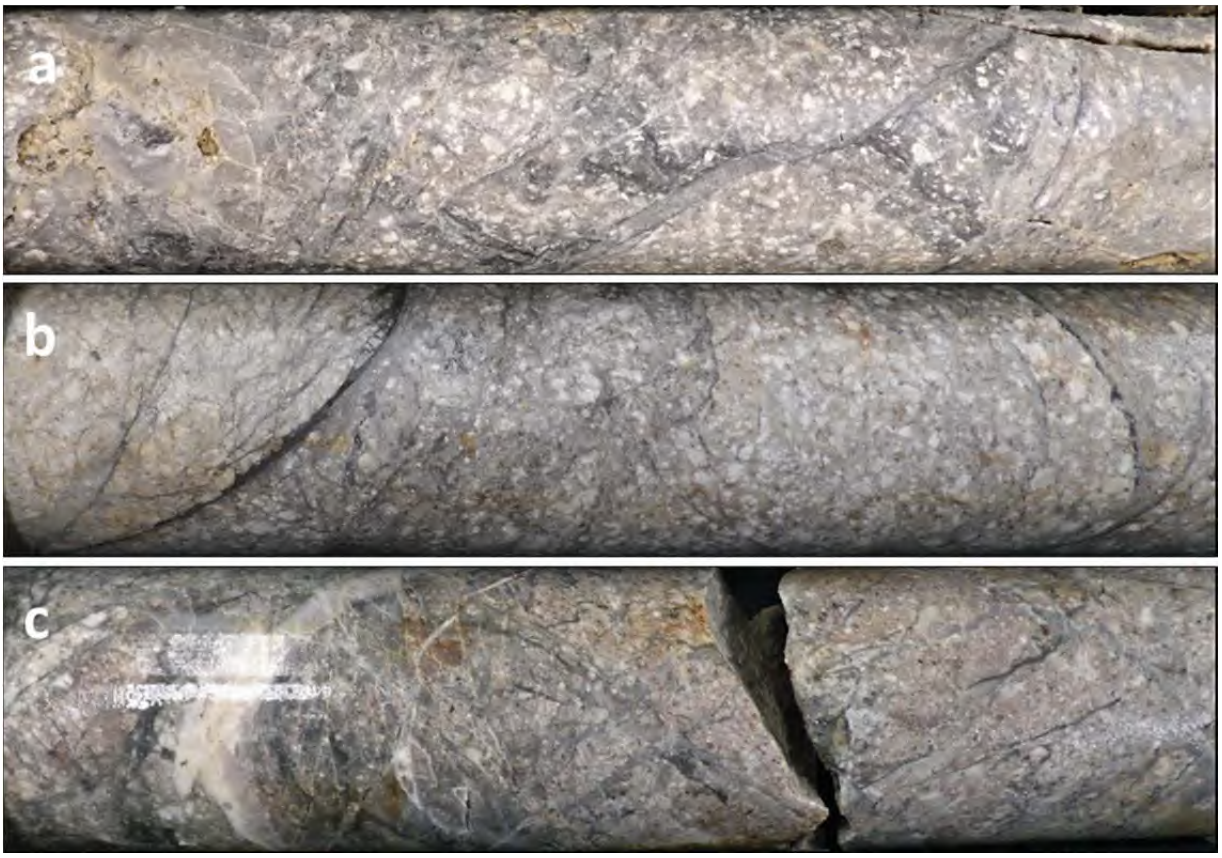
3.1.3. Taban Bloğu

3.1.3.1.Sia2 (Subvolkanik Andezit 2)

BKB yapının taban bloğunda gözlenen, groundmass baskın 0,2 0,3 cm' ye kadar feldspar ve kuvars fenokristalleri içeren taze yüzeyi bej-pembe tonlarında asidik-ortaç nitelikli feldspar ± kuvars porfiri olarak tanımlanmaktadır. Feldsparlarında genellikle killeşmenin hakim olduğu bu birimde, yer yer feldsparların serizitleştiği, ve buna eşlik eden pirit ve kuvarsın varlığı ile (QSP) alterasyonu ile ağsı gri silika damarcıkları tarafından kesildiği gözlenmiştir. Kumtaşını keserek yerleşen Sia2 birimi, Hbx tarafından kesilmekte ve tavan bloğunda yüzlek vermemektedir. Kontaklar boyunca yer yer gri silika çimentolu carapace breşler mevcuttur.

Arge Test' e yaptırılan (1 adet) ince kesit çalışmalarında, Sia2'nin feldspar ve mikrokristalen kuvars ile daha düşük miktarlarda serizit karışımından oluştuğu ve büyük ihtimalle kristalleşme sonucu camsı volkanik ana kütlenin, mikrokristalen kuvars-feldspar karışımına altere olduğu belirtilmektedir. Kristalleşmiş doku içerisindeki feldspar (plajiyoklas) fenokristallerinin, büyük bir çoğunluğunun serizitleştiği ve killeştiği, bu sebeple birincil mineralojik bileşiminin saptamanın mümkün olmadığı belirtilmiş, fakat, kısmen altere sanidin bileşiminde alkali felsparlar saptanmıştır.

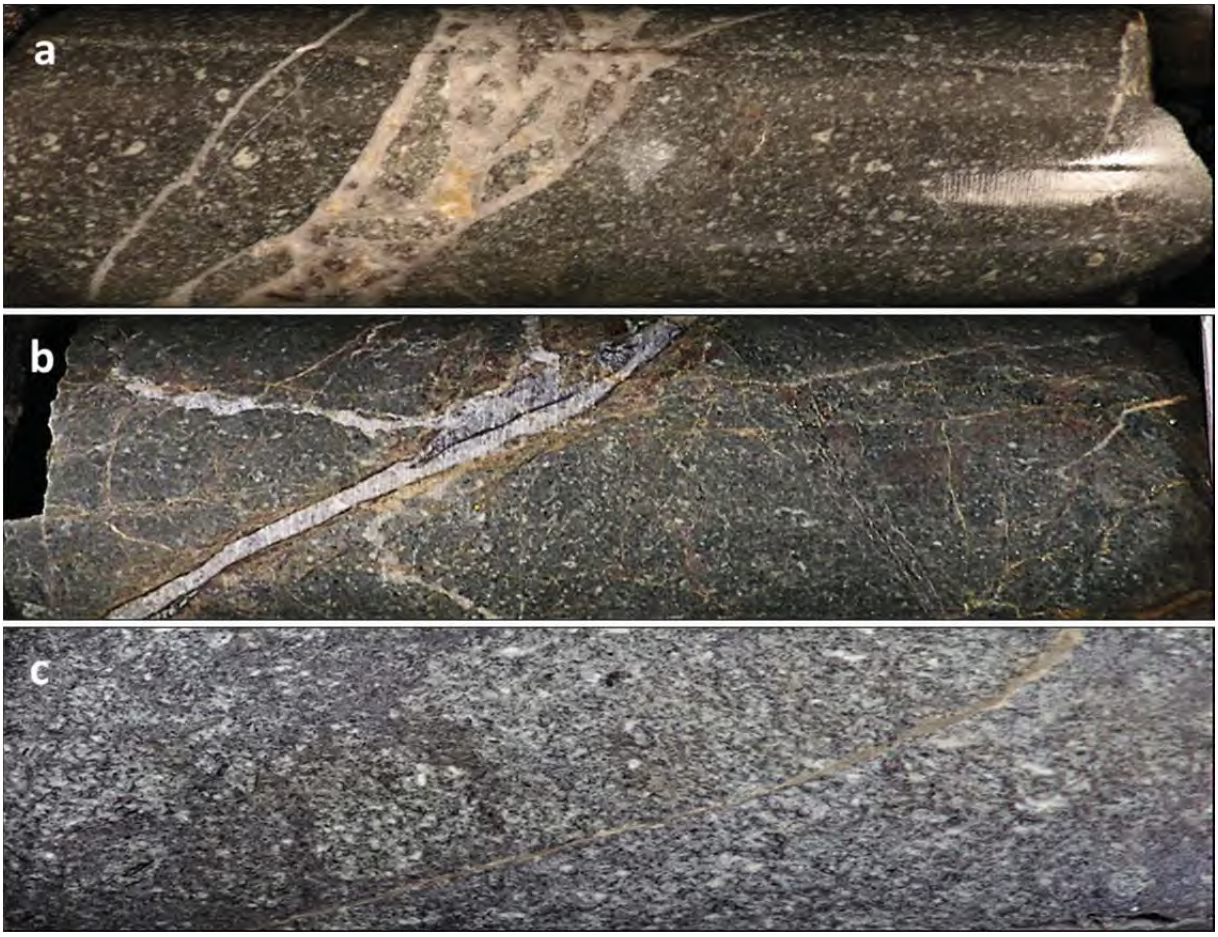
Kayacın, kuvars ± kriptokristalen bileşiminde koyu renkli kuvars jel tarafından kesildiği ve çatlakların geç evre mikro-mezokristalin kuvars damarcıklarıyla doldurulduğu bildirilmiştir (Şekil 8).



Şekil 8 a)KDH20-033 b)KDH20-079 c)KDH20-074 nolu kuyularda gözlenen stokvörk gri silika-sülfit ve saccaroidal kuvars damarları tarafından kesilen kil altere Sia2' ye ait görüntüler

3.1.3.2.Andezit

BKB yapının taban bloğunda yer alan, kalk-alkali ortaç nitelikli, taze yüzeyi yeşil-pembe tonlarında değişen, akma düzlemleri ve otobreşler gözlenen feldspar ± biotit firik andezitik volkaniklere verilen addır. Genel olarak proplitik (chl>ep) altere olarak gözlenen bu birim, SIA2 tarafından kesilmekte (KDH19-018) ve Au-Ag anomalileri vermemektedir (Şekil 9).



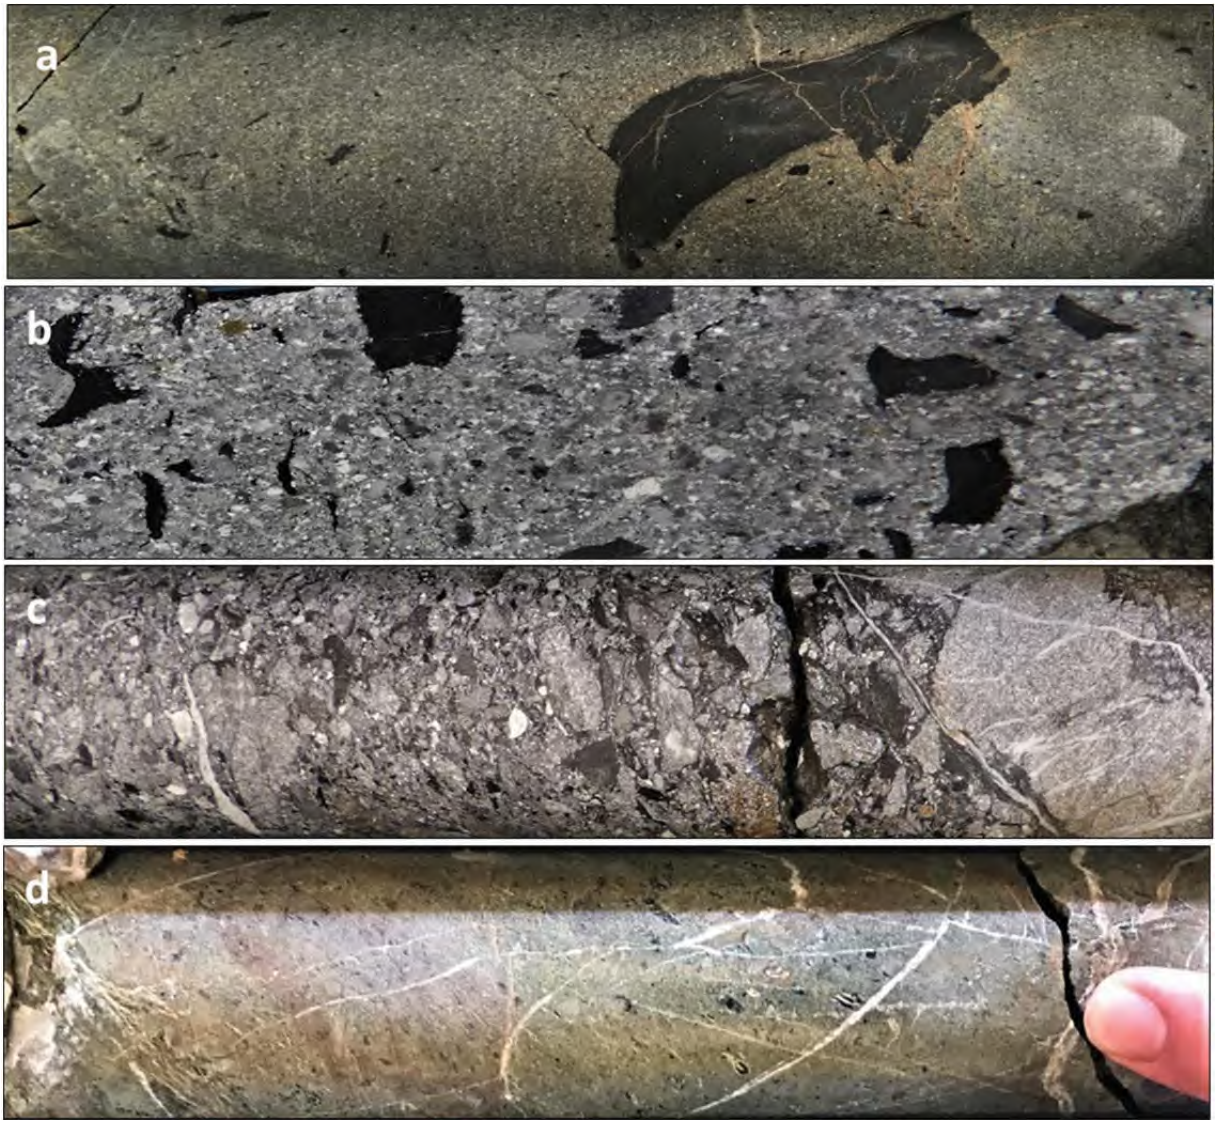
Şekil 9 a-b)KDH19-018 c)KDH19-011 nolu kuyularda gözlenen karbonat damar/damarcıkları tarafından kesilen proplitik altere VIA birimine ait görseller

3.1.4. Sedimanter (Kumtaşı-Ssa/Çamurtaşı-Sms/Çakıltaşı-Sco) ve MetaSedimanter (MSed) Birimler

BKB yapının taban bloğunda yüzlek veren, çoğunlukla gri silika, tarak dokulu kuvars ve sülfit damarları içeren, birbirleriyle geçişli- ince taneli, orta-kötü boylanmalı, çamurtaşı klastları içeren kumtaşları ve orta-kaba taneli kuvars- kumtaşları (Ssa), genellikle kil altere yoğun dissemine pirit içeren çamurtaşları (Sms) ve kaba tane destekli polimiktik, ağırlıkla volkanik, metasedimanter ve karbonatlı klastlar içeren çakıltaşlarından (Sco) oluşan klastik seri, kıvrımlı olarak gözlenen ardalanmalı metakumtaşı-metaçakıltaşı ve metaçamurtaşından oluşan metamorfik/metasedimanter (MSed) birimini, açısal uyumsuzlukla örter ve her iksisi de Sia2 tarafından kesilmektedir.

Arge Test' e yaptırılan (1 adet) ince kesit çalışmalarında, kumtaşı (Ssa) biriminin, 0,1-1,2 mm arasında değişen kötü boylanmış ve yarı köşeli mono /polikristalen kuvars ve daha düşük oranlarda değişen muskovit ve feldspardan oluşan mineral parçacıkları ile baskın olarak ince taneli volkanik klastlarla ile birlikte, daha az oranlarda, metamorfik ve çört klastları gözlenmiştir. İnce taneli makriks serizit pulları ve kuvarstan oluşmakta ve genellikle klastlar, doğrudan birbirleriyle kontakt halindeyken, bazı bözümlerde ince taneli matriks, boşlukları doldurmaktadır.

İnce kesit çalışmalarında ayrıca, ince taneli dissemine piritler ile demir-oksit damarlarında götit kalıntıları gözlenmiştir (Şekil 10).



Şekil 10 a)KDH19-005 nolu kuyuda gözlenen çamurtaşı klastları içeren ince taneli kumtaşına ait görsel b)KDH19-004 nolu kuyuda gözlenen çamurtaşı klastları içeren ince-orta taneli kuvars kumtaşına ait görsel c)KDH19-018 nolu kuyuda gözlenen kaba tane destekli çatlak

3.2. Karakaya Kompleksi ve Tektonik

Temel birimleri oluşturan ve cevherleşmenin kuzeyinde yaygın olarak yayılım sunan sedimanter ve metasedimanter kayaçlar literatürde **"Karakaya Kompleksi"** olarak geçen kaya birlikteliklerinin elemanlarıdır. Bu birim İzmir-Ankara-Erzincan zonu boyunca kuzeybatı Anadolu'dan Doğu Karadeniz güneyine kadar bir uzanım sunmaktadır.

Karakaya Kompleksi, Pontidler'deki güçlü şekilde deformasyona uğramış ve yer yer metamorfizmaya maruz kalmış Permo-Triyas orojenik seriler için kullanılan genel bir tektono-stratigrafik terimdir. "Karakaya Formasyonu" adı ilk olarak 1975 yılında Bingöl ve arkadaşları (1975) tarafından kullanılmıştır. Şengör ve arkadaşları (1984) tarafından "Karakaya Kompleksi" olarak yeniden adlandırılmıştır. Karakaya Kompleksi, Permiyen ve Triyas yaşlı, yüksek derecede deformasyona uğramış ve kısmen metamorfizmaya uğramış klastik/kırıntılı ve volkanik kaya serilerinden oluşmaktadır. Okay ve Göncüoğlu (2004) bu kompleksi iki bölümde incelemiştir (Şekil 11).

Yapısal olarak alt kısımda yer alan Alt Karakaya Kompleksi, yeşilşist ve mavişist fasiyeslerinde metamorfizmaya uğramış mafik lav-mafik piroklast-şeyl-kireçtaşı ardalanmasından oluşur ve bu metamorfizma geç Paleozoyik veya Triyas döneminde gerçekleşmiştir. Yapısal olarak üst kısım ise, yüksek derecede deformasyona uğramış Permiyen ve Triyas yaşlı klastik, volkanoklastik ve volkanik kayaçlardan ve bunların içinde bulunan farklı yaşlardaki egzotik kireçtaşı bloklarından oluşur. Paleotetis okyanusunun yığışım karmaşığı olarak da yorumlanan bu seride metamorfizması çok düşükden alt yeşilşist fasiyesine kadar değişebilen metamorfik kayalar da içermektedir.

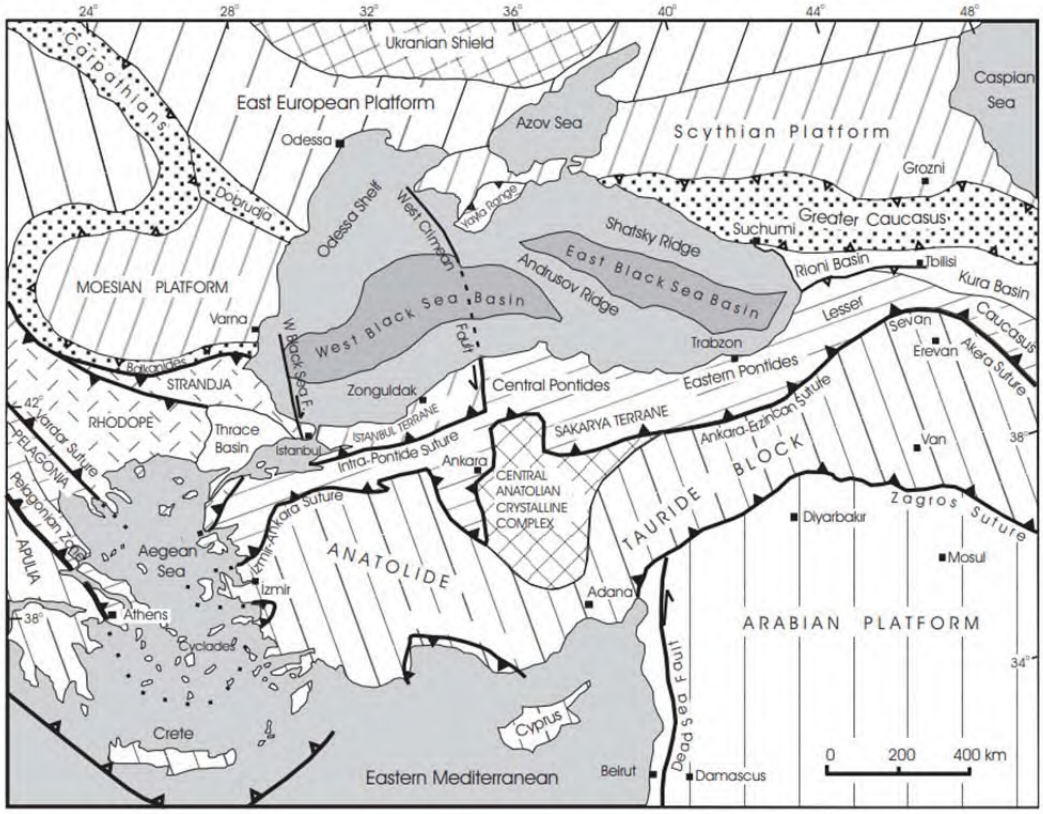
Karakaya Kompleksi'nin yalnızca Pontidlerin Sakarya Zonu (Okay, 1989) ya da Sakarya Kıtası (Göncüoğlu ve diğ., 1997) ile sınırlı olduğu konusunda genel bir görüş birliği vardır. Pontidlerin geri kalan kesimlerinde ve Anadolu-Torid Bloğu'nda bu kompleks bulunmamaktadır (Şekil 12, Şekil 13).

Karakaya Kompleksi'nin çökelme ortamı ve tektonik evrimi ile ilgili olarak günümüzde iki farklı model bulunmaktadır.

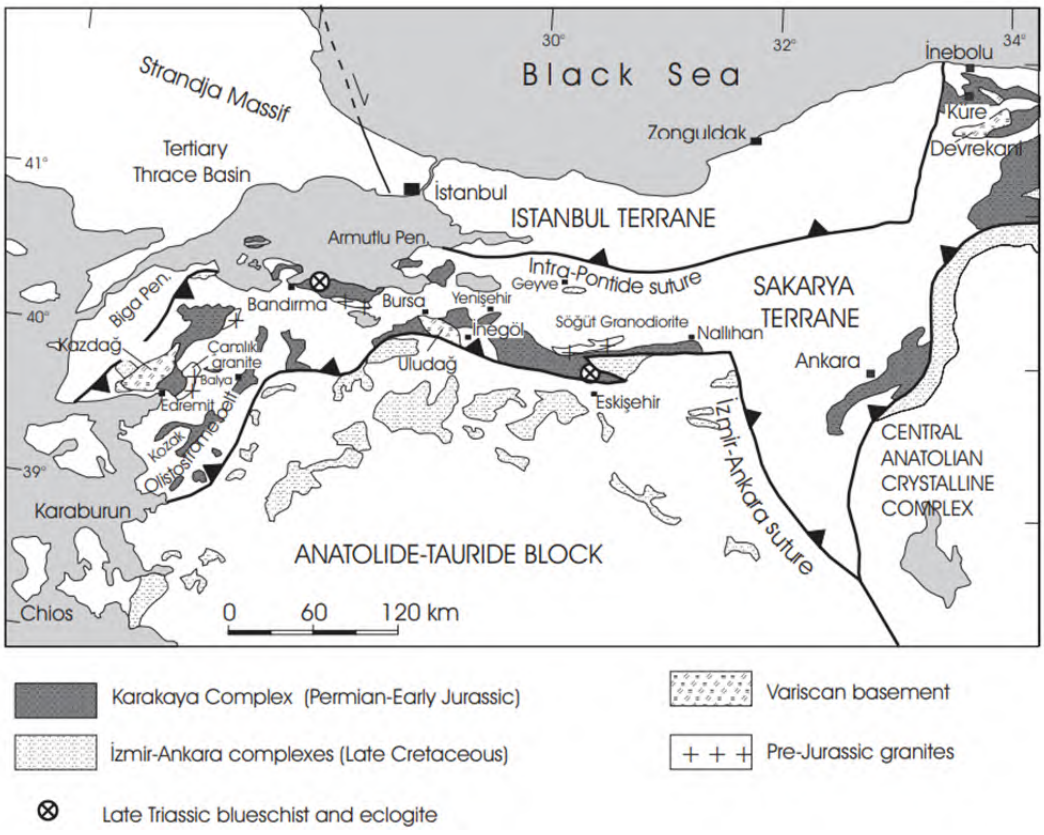
-Rift modeli, Karakaya Kompleksi'nin Geç Permiyen'de oluşmuş bir riftten geliştiğini, bunun daha sonra kenar okyanusal bir havzaya dönüştüğünü ve bu havzanın Geç Triyas sonunda kapanarak sonlandığını öne sürer.

-Dalma-batma ve akresyon (bindirme) modeli ise Karakaya Kompleksi'ni, Palaeo-Tetis'in dalma-batma zonunda oluşmuş yığışmalı birimlerden oluşan bir yapı olarak değerlendirir.

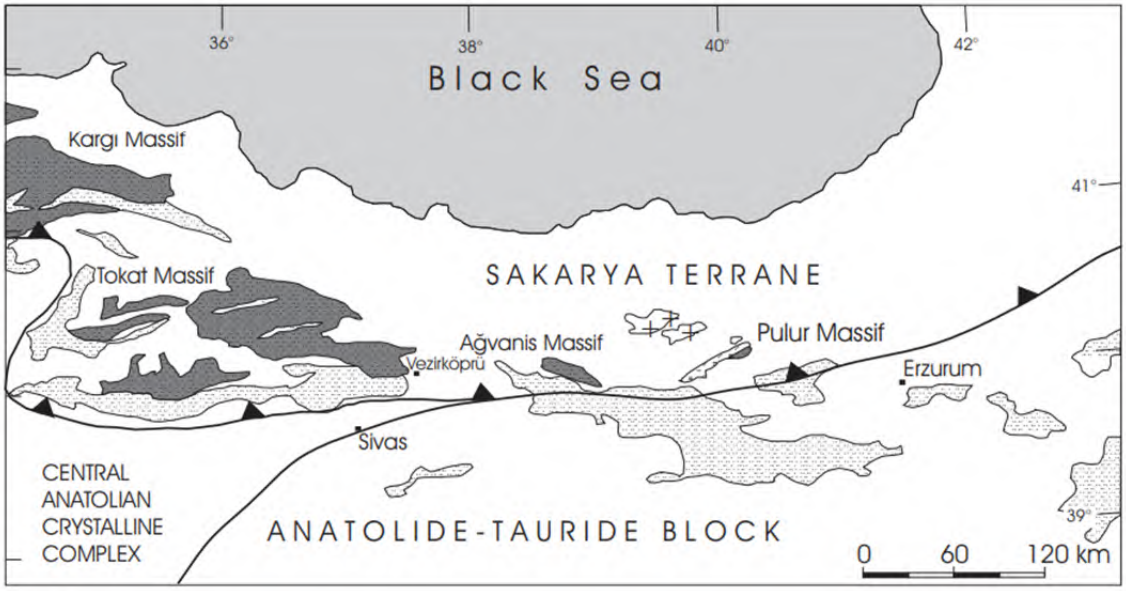
Çalışma alanında temel birimleri oluşturan bu birim taban bloğunda yer almaktadır. Literatürde Üst Karakaya bölümüne karşılık gelmektedir. Saha çalışmaları sırasında yapılan jeolojik gözlemler ve sondaj çalışmalarında elde edilen bulgulara göre kumtaşı, kiltaşı, çakıltaşı, kireçtaşı ve metasedimanter kayaçlar Karakaya Kompleksi'nin yapısal olarak üst kısımlarına tekabül etmektedir. Sahada yapısal olarak altta yer alan Alt Karakaya bölümlerini yansıtan yüksek derece metamorfik kayaç birimleri gözlenmemektedir.



Şekil 11 Türkiye Tektonik Hatları Haritası (Okay & Tüysüz, 1999)



Şekil 12 Karakaya Kompleksi'nin yayıldığı coğrafya (Okay & Göncüoğlu, 2004)



Şekil 13 Karakaya Kompleksi'nin yayıldığı coğrafya-Doğu Karadeniz (Okay & Göncüoğlu, 2004)

3.2.1. Cevherleşme

Cevherleşme literatürde geçen tipik bir düşük sülfidasyon epitermal sistem olarak tanımlanmıştır. Saha gözlemleri, sondaj çalışmaları ve jeokimyasal çalışmalar sonucu elde edilen bulgular cevherleşmenin kuvars damarı ve faylarla sınırlı olarak geliştiğini göstermektedir. Sahada kuvars damarı çevresinde yaygın bir kil alterasyonu görülmek ile beraber cevher zonuna yakın kesimlerde yaygın silisleşme ve stokvörk ağsal kuvars damarları görülmektedir. Cevherden uzaklaştıkça alterasyon mineralleri propilitik alterasyon mineral parajenezine doğru değişim göstermektedir. Analiz sonuçlarına bakıldığından kuvars yapı ve dokusal özelliklerine göre Au-Ag tenörleri değişkenlik göstermektedir. Breşik dokudaki kuvars, ginguro bantları içeren masif kuvars, kafes dokulu kuvars ile sülfitçe yoğun flt2 olarak kodlanan ve cevherleşmeyi tabandan sınırlayan fay ile kuvars damarı önündeki açık renkli, sakkoroidal kuvars klastları içeren, flt1 olarak kodlanan birimde yüksek Au-Ag anomalileri elde edilmektedir (Şekil 14, Şekil 15).

Şekil 14 Kuvars yapı ve dokularından görseller

Şekil 15 Cevherli zonlardan görseller

3.3.Depremsellik

Ruhsat alanı genelinde 14 farklı noktada tek istasyon, 3 bileşen ve geniş bant özellikli mikrotremor ölçümleri (Nakamura (1989) yapılmıştır. Çalışma sonucunda her ölçüm noktası için gözlemsel zemin transfer spektrum grafikleri ile V_{s30} hız değerleri hesaplanmıştır (Bignardi vd. 2016) (Tablo 1).

Tablo 1 Ruhsat alanında 14 farklı nokta için sahaya özgün hesaplanmış V_{s30} huz değerleri

Nokta Adı	X (UTM WGS84)	Y (UTM WGS84)	Vs30 (m/sn)	TBDY (2018) Zemin Sınıfı

Şekil 17 Proje sahası Türkiye deprem tehlike haritaları (AFAD) yeri ve yerel zemin sınıfı ZB için girdi ve çıktı parametreleri

4. HİDROJEOLOJİ

Proje sahasında yer altı suyu taşıyan formasyonları tespit etmek ve proje sahasının hidrojeolojik yapısını ortaya koymak amacıyla öncelikle MTA ve DSİ tarafından yapılan araştırmalar incelenmiş, bu kurumlardan elde edilen bilgiler değerlendirilmiştir. Daha sonra ÇED sahasının içinde, zemin etüt çalışmaları için karotlu olarak açılmış kuyular incelenmiştir. Bu kuyularda, bölgenin hidrojeolojik yapısının belirlenmesi amacıyla Basınçlı Su Testleri ve Permeabilite deneyleri yapılmıştır. Test sonuçları Bölüm 6.1.1 ve Bölüm 6.1.2'de detaylı olarak verilmiştir.

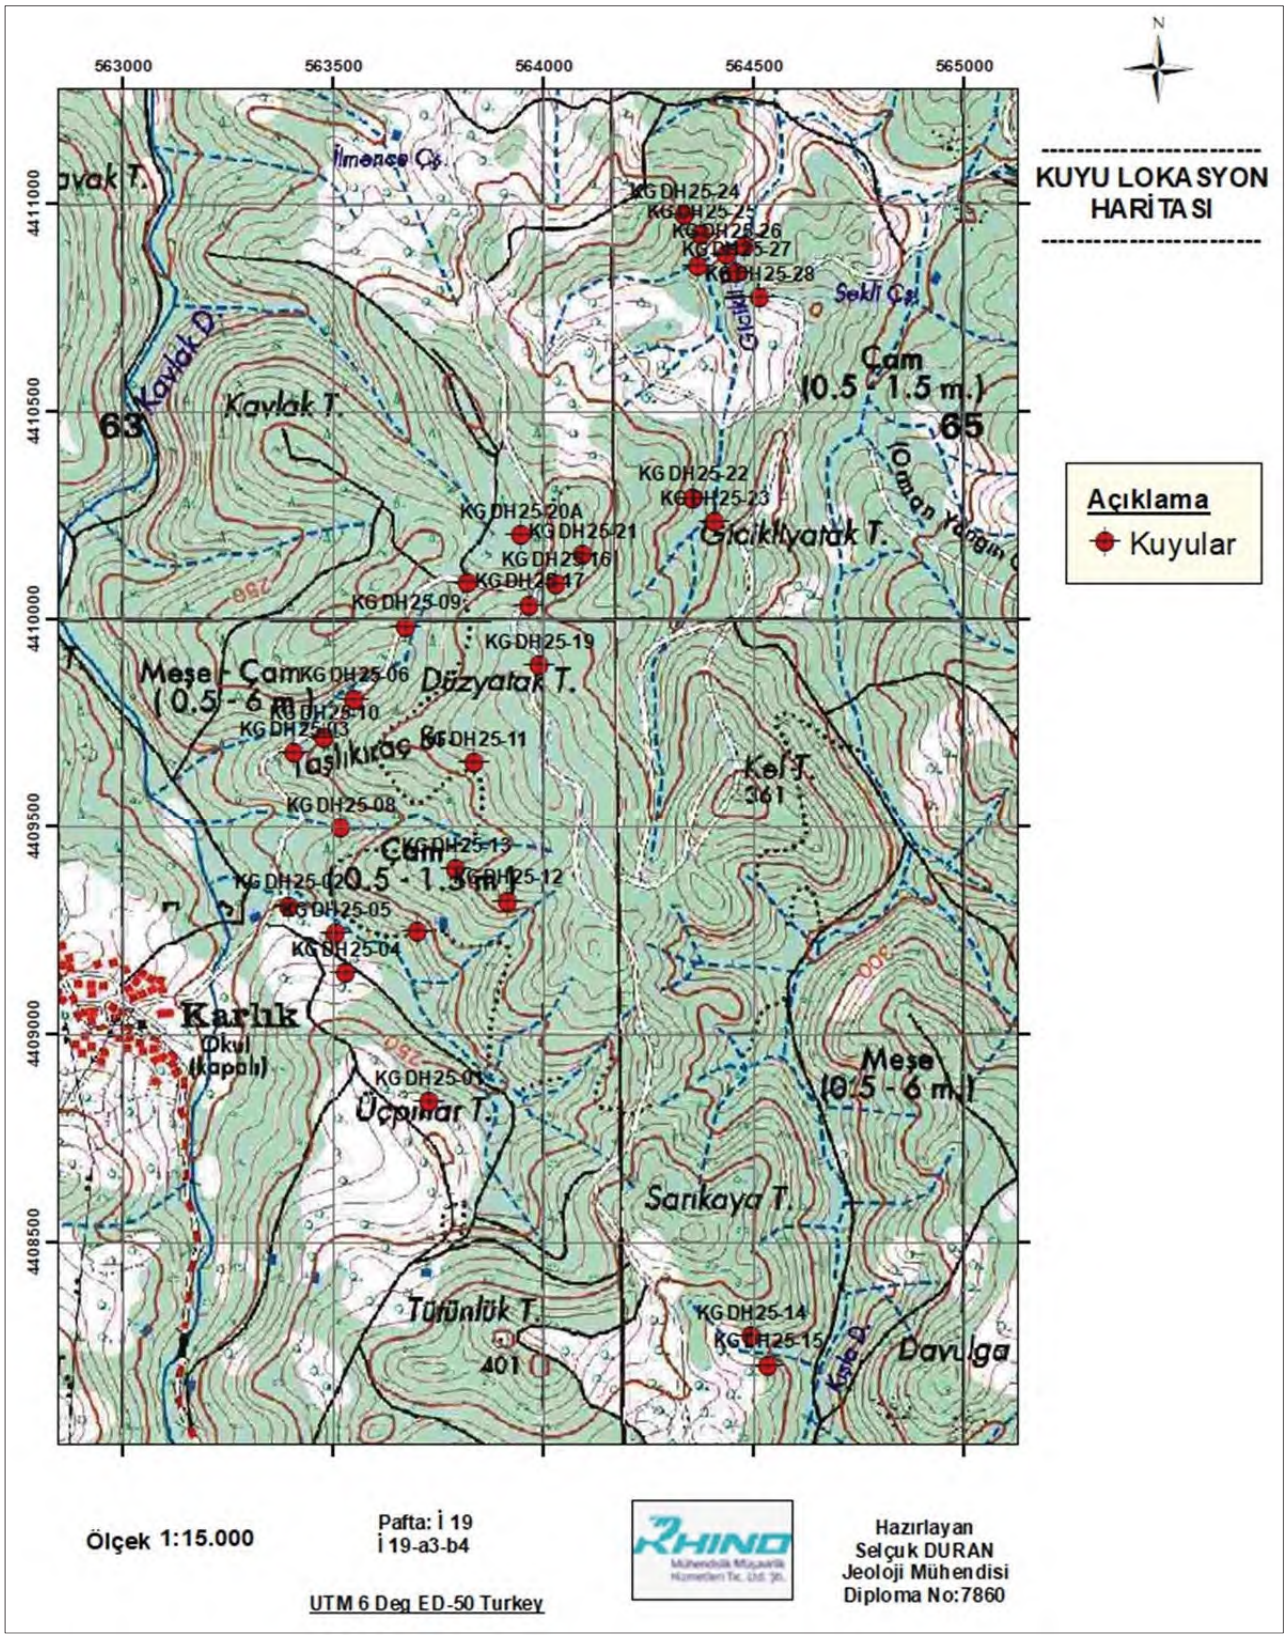
Bu verilere göre bölgedeki jeolojik birimlerin hidrojeolojik özellikleri belirlenmiştir. Kuyulara ait 1/15.000 ölçekli lokasyon haritası Şekil 18'de verilmiştir.

BST sonuçlarına göre;
Servis Alanı, Sızıntı Havuzu, Temiz Su Havuzu bölgelerinde Karakaya formasyonu (TRkk) **Geçirimli** özelliktedir.

Proses tesis alanı bölgesinde bulunan Karakaya formasyonu (TRkk) lokal olarak bazı seviyelerinde **Az Geçirimli özelliğe sahip olmakla birlikte, ağırlıklı olarak Geçirimli ve Çok Geçirimli** özelliktedir.

Pasa Alanında açılmış olan kuyularda Karakaya formasyonu (TRkk) genellikle **Geçirimli** özelliğe sahiptir. Ancak bu bölgede (KGDH25-12 ve KGDH25-13 kuyuları verilerine göre) derinlere doğru özellikle 280 – 310 m kotlarında **Az Geçirimli-Geçirimsiz** özellik kazanmaktadır.

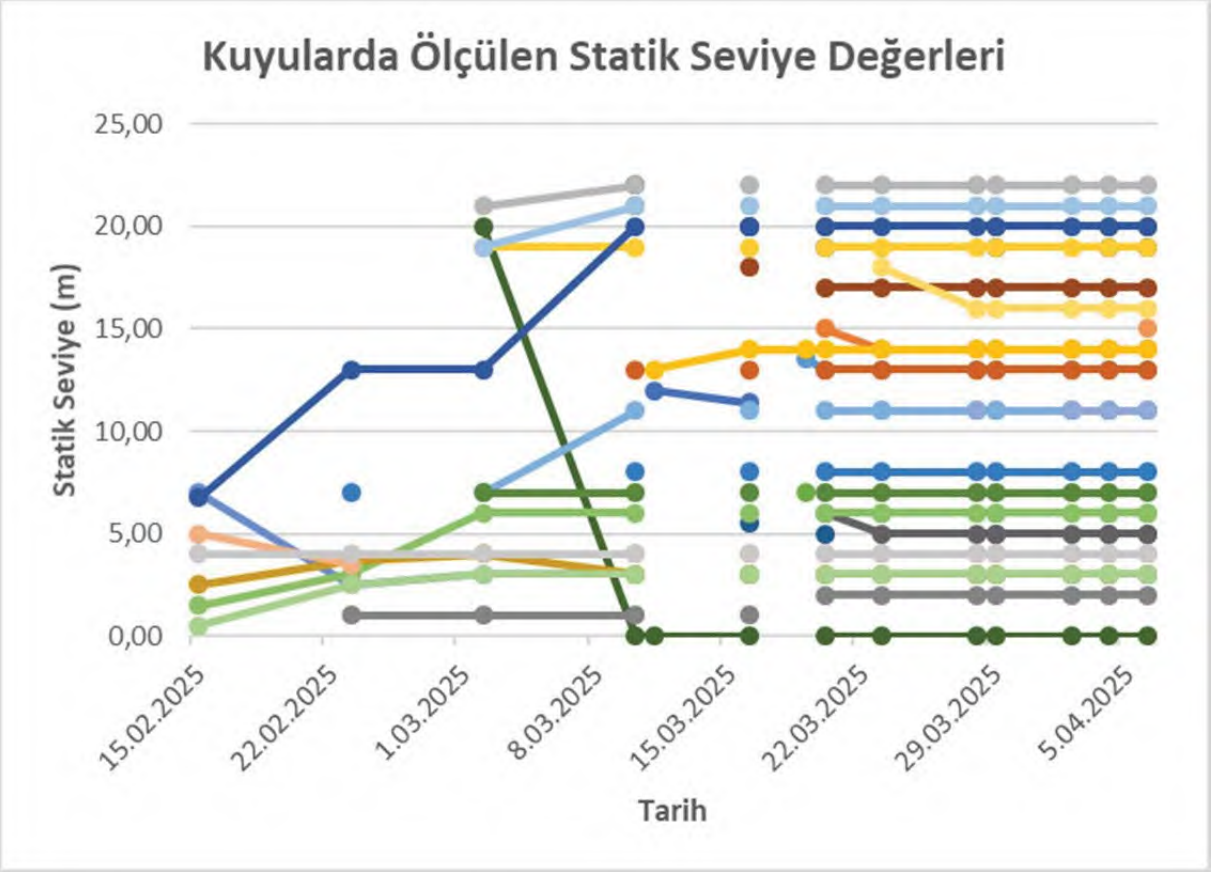
Atık depolama tesisi bölgesinde açılmış olan kuyularda da Karakaya formasyonu (TRkk) tüm kuyularda ve seviyelerde **Geçirimli** özelliktedir.



Şekil 18 Temel sondaj kuyularına ait lokasyon haritası (Ölçek: 1/15.000)

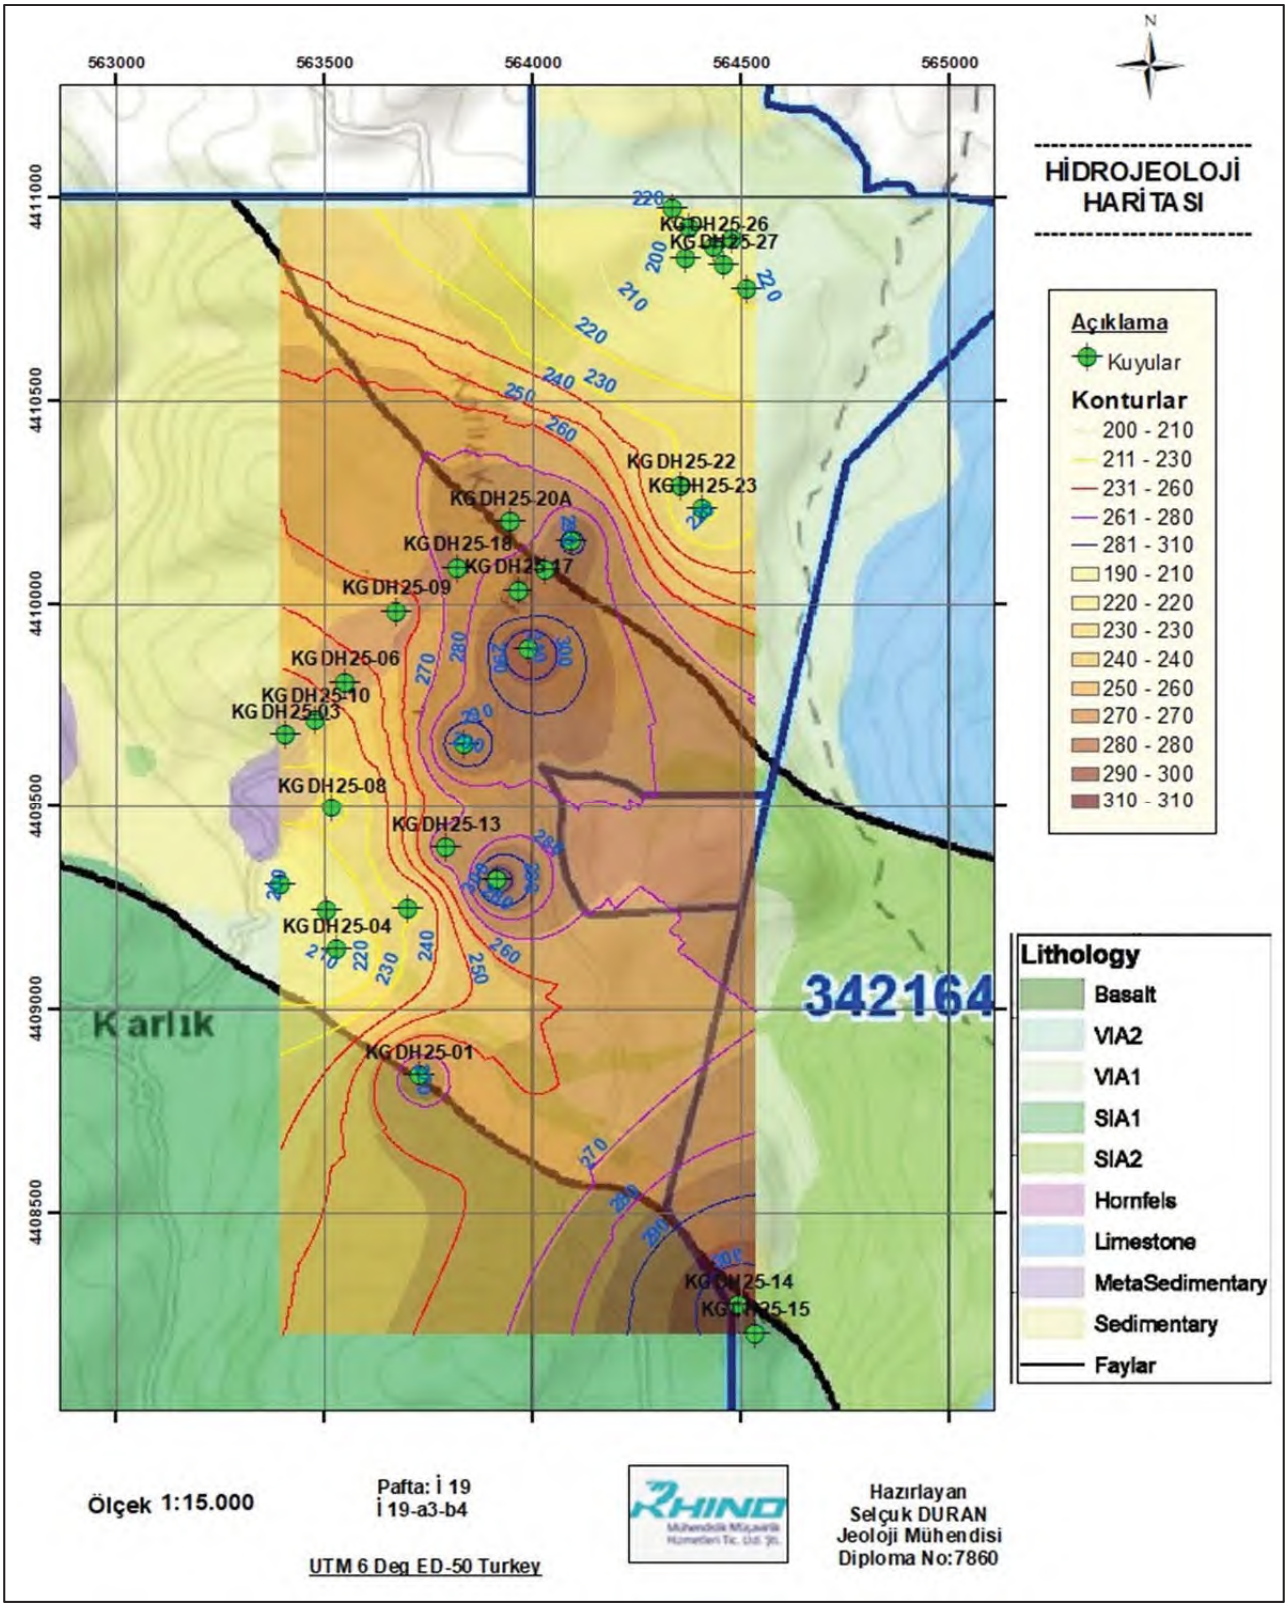
Proje alanında ünite sahalarında açılmış olan temel sondaj kuyularında yapılan yer altı suyu ölçümleri Tablo 3'de verilmiştir.

Temel sondaj kuyularında Tablo 3'de görüleceği gibi belli periyotlarda yer altı suyu ölçümleri yapılmıştır. 2025 yılının Şubat, Mart ve Nisan aylarında yapılan ölçümlere ait grafik Şekil 19'da verilmiştir. Grafik incelendiğinde, kuyulardaki yeraltısuyu seviyesinin deönemsel olarak çok fazla bir değişiklik göztermediğ gözlenmektedir. İlk ölçümlrede göreülen farklılıkların kuyuların açılması sırasında kuyularda kalan sondaj suyundan kaynaklandığı düşünülmektedir.



Şekil 19 Temel sondaj kuyularında ölçülen yer altı suyu statik seviye grafiği

Yapılan ölçümlere göre bir yer altı suyu dağılım (kontur) haritası çizilmiştir. Yeraltısuyu verileri incelendiğinde yeraltısuyunun topografik yapıya bağlı olarak üst kotlardan alt kotlara doğru azaldığı görülmektedir. Üst kotlarda 310 m olarak gözlenmiş oılan yeraltısuyu kot değeri, vadilere doğru inildikçe 200 m kotlarına kadar düşmektedir. 1/15.000 ölçekli yeraltısuyu dağılım haritası Şekil 20'de verilmiştir.



Şekil 20 Yer altı suyu dağılım haritası (Ölçek: 1/15.000).

Tablo 3 Temel sondaj kuyularında ölçülen yer altı suyu seviyeleri

5. MÜHENDİSLİK JEOLOJİSİ

Araştırma programı işveren tarafından hazırlanmış olup aşağıdaki gibidir.

a) Yapı yerlerinde Mühendislik Jeolojisi
b) Karotlu sondaj yapılması
c) Yerinde deneyler
d) Laboratuvar deneyleri

5.1.Mühendislik Jeolojisi Haritalamaları

Proje alanının Jeolojik haritalaması Rhino Mühendislik tarafından yapılmıştır. Yapı yerlerinin jeolojik haritaları EK-1'de verilmiştir.

J-01: Genel Jeoloji Hatirası 1/5000

J-02: ADT Gövde Kesiti

J-04 ADT Gövde En Kesiti

J-05 ADT Gövde Geçirimlilik

J-06 Temiz Su Havuzu En Kesit

J-07 Temiz Su Havuzu Geçirimlilik

5.2.Sondajlar ve Araştırma Çukurları

Proje kapsamında 30 kuyuda toplam 836 m sondaj çalışması yapılmış olup genel kuyu bilgileri ve yerinde deneyler Tablo 4'de verilmiştir. Kuyu yerleri işveren tarafından belirlenmiştir.

Tablo 4 Tamamlanan Sondaj ve Yerinde Deneyler Çalışmaları

Sondaj logları sahadaki sondaj çalışmalarıyla eşzamanlı olarak, ilgili BS (1981) ve ISRM şartnamelerine uygun, Devlet Su İşleri (DSİ) tarafından onaylanabilir şekilde, hazırlanmıştır.

Sondaj ekipmanları ve metodu, matkap ucu tipi, karotiyer tipi, karot çapı, muhafaza borusu üst ve alt derinliği, üst ve alt derinlikler, toplam karot verimi yüzdesi, her bir karot manevrası için kaya/toprak tanımlamaları loglara işlenmiştir. Numune alma derinlikleri, numune tipleri, deney derinlikleri, sondaj çalışmaları sırasında yeraltı suyu derinlikleri, sondörlerin adı, logları yapanların adları gibi bilgiler de sondaj loglarında gösterilmiştir. Toplam Karot Verimi (TCR), Sağlam Karot Verimi (SCR), Kaya Kalite Tanımı (RQD), çatlak sıklığı, ayrışma ve dayanım bilgileri dahil edilmiştir.

Sondaj araştırmalarına ilişkin günlük kayıtlar, sondör tarafından hazırlanmış ve her çalışma gününün sonunda rapor haline getirilmiştir. Sondaj logları saha mühendisi tarafından sahada hazırlanmış ve saha ofisinde taslak haline getirilmiştir. Bu loglar laboratuvar deney sonuçları da gözönünde bulundurularak revize edilmiştir. Sondaj logları, karot fotoğrafları ve BST/geçirimlilik test sonuçları önceden işverene iletilmiştir.

Karot alma HQ-NQ (wireline) tip karotiyer kullanılarak gerçekleştirilmiştir. Karot manevra uzunlukları, şartnameye uygun olarak, zayıf kaya koşulları nedeniyle gerekli yerlerde karot yüzdesini arttırmak için kısaltılmıştır.

Karot numunelerini muhafaza etmek ve saklamak için MTA ve DSİ gibi devlet kurumları tarafından kabul edilen plastik karot sandıkları kullanılmıştır. Her bir karot manevra boyu plastik ayırıcılar ile ayrılmıştır. Her tamamlanan sondajın karot sandığı sahada işveren tarafından gösterilen yerlere gönderilmiş ve burada saklanmıştır. Karot sandıkları uygun şekilde fotoğraflanmıştır. Tasarımcı tarafından seçilen karot numuneleri işverenin talimatı uyarınca paketlenmiş, etiketlenmiş ve ilgili laboratuvara gönderilmiştir.

5.3. Sondaj Bulguları

Proje sahasında, planlanan ünitelerde yapılan temel sondaj çalışmalarına ait deteylı açıklamalar aşağıda tablolarda verilmiştir.

Tablo 5. Atık Depolama Tesisi Temel Sondaj Çalışmalarına Ait Veriler

6. ZEMİN VE KAYA MEKANİĞİ ÇALIŞMALARI

6.1.Arazi Deneyleri

Sahada yapılan 30 adet sondajda tespit edilen jeoteknik birimlerin geçirimliliğini ölçmek üzere Basınçlı Su Testi ve Permeabilite Testi yapılmıştır.

6.1.1. Permeabilite Deneyleri

Düşen ve sabit seviyeli geçirimlilik deneyleri, sahada temel sondaj çalışmalarında rastlanılan, çok-tamamen ayrılmış birimlerde ve zeminlerde yapılmıştır.

Düşen seviyeli permeabilite deneyi, pek iyi geçirgen olmayan kohezyonlu zeminlerin permeabilitesini ölçmek için kullanılmıştır. Bu deneyde, suyun zemin numunesinden akıp gitmesinden dolayı açık bir boruda meydana gelen seviye düşmesi oranı ölçülür.

Sabit seviyeli perméabilité deneyi, bir zaman süreci içersinde, uzunluğu ve alanı bilinen bir zemin numunesinden geçen suyun miktarını verir. Deney esnasında su seviyesini sabit tutmak İçin su deposu devamlı olarak dolu tutulmuştur. Sabit seviyeli permeabilite deneyi, permeabilitesi yüksek olan kohezyonsuz zeminler İçin kullanılmıştır.

Düşen seviyeli permeabilite deneyinde, kuyu tamamen su ile doldurulur. Seviyedeki düşüm başlangıçtan itibaren belli sürelerde okunur. Okumalar 0, 5, 10 dakikalarda alınmıştır. Test süresince kuyu tabanında herhangi bir sediman birikmesi olup olmadığı kuyu derinliği ölçülerek tespit edilir.

Sabit seviyeli permeabilite deneyinde, kuyu önce muhafaza tabanına kadar dikkatlice temizlenir, deliğin tabanından en az 1 metre yukarıda tutulmuş tij yardımı ile kuyu içerisinde su sabitlenene kadar debimetreden sabit bir oranda sondaj kuyusuna pompalanır. Sabit seviye 5 dakikalık iki zaman aralığında 150dakikalık bir süre için tutulmuştur. Eğer su seviyesi stabilize edilememişse, toplam su kaybı her bir zaman aralığı için kaydedilmiştir.

Geçirimlilik deneyleri, proses tesis alanında 1 adet, pasa sahasında 3 adet geçirimlilik deneyi yapılmıştır.

Geçirimlilik katsayısı aşağıdaki denklem ile hesaplanır:

$$k = \frac{Q}{2\pi H L} \ln \frac{L}{r}$$

k	saniyede metre cinsinden geçirimlilik (m/s)
Q	saniyede metre küp cinsinden enjeksiyon oranı (m^3/s)
H	metre cinsinden deney zonunda suyun basınç yüksekliği (m)
L	metre cinsinden deney zonunun uzunluğu (m)
r	metre cinsinden deney zonunun yarıçapı (m)

Tablo 11'de verilen zeminler Tablo 12'deki gibi geçirimlilik katsayısına göre sınıflandırılmıştır.

Tablo 11 Sabit seviyeli permeabilite deneyi sonuçları

Ünite Adı	Sondaj No	Derinlik (m)	k (cm/sn)	Tanımlama	Birim
Proses Tesis Alanı	KGDG25-18	1,00-3,00	8,59E-04	Geçirimli	Kumtaşı-Çarmurtaşı (RQD=0)

6.1.2. Basınçlı Su Testleri

Kaya formasyonlarında geçirimliliği ölçmek için basınçlı su testleri (BST) tek paker kullanılarak uygulanmıştır. Deneylerde asgari 1 metre uzunluğunda şişen kısmı olan hidrolik pakerler kullanılmıştır. Çoğunlukla HQ ile sondaj yapılan kuyu boyutlarını kaplayacak şekilde uygun paker çapları sağlanmış ve yıkıntı yapan sondaj kuyularında boyut NQ'ya düşürülmüştür. Üst deney bölümünü sızdırmaz hale getirmek için pakerlar kullanılmıştır. Yüksek basınç (30 bar'a kadar) kapasiteli pakerlar, standart debimetre basınç ölçerler ile ayarlanabilir basınçlı 200 L/dak kapasiteli su pompaları ve su tankları deney sisteminin diğer bileşenleri olarak kullanılmıştır. 0.1-1 bar hassas basınç ölçerler ve 1 L/dak hassas debimetreler deney basınçlarının ve debilerinin ölçülmesinde kullanılmıştır. Deney prosedürleri için spesifik seri numarasına ve teknik özelliklere sahip basınç ölçerler ve debimetreler kullanılmıştır. Pakerler deney bölümünü uygun şekilde kapatmak için 25 bar'a kadar şişirilmiş ve etrafındaki kaya kütlesini etkilememesine çalışılmıştır.

Tek paker kullanılarak yapılan deneyler (basınçlı su testleri, BST) 2 metrelik deney zonlarında yapılmıştır. Deney basıncı Bourdon basınç ölçerler ile yüzeyde ölçülmüştür. Paker şişirildikten sonra, temiz su deney zonuna pompalanmış ve su girişleri genelde farklı basınçlarda (zaman aralıklarında) ölçülmüştür.

Her bir deney basıncındaki (zaman aralığındaki) su girişi, 5 dakikalık iki zaman aralığında ölçülmüş ve şu verileri içeren deney formlarına kaydedilmiştir: Kullanılan paker tipi, paker basıncı, deney tarihi, deney zonunun alt ve üst derinliği, muhafaza borusunun tabanı, vb. Uygulanan basınçlar, deney derinliğinde hidrolik çatlatmayı önlemek için, deney derinliğine ve doğal yeraltı suyu derinliğine göre düzenlenmiştir.

Tüm paker deneyleri (BST) DSİ ve İngiliz Standartlarına (BS 5930) uygun olarak gerçekleştirilmiştir. Lugeon parametresi ile birlikte kaya kütlesi eşdeğer geçirimlilik katsayısı, deneyin her bir basınç aşaması için aşağıdaki formül kullanılarak BS 5930 yöntemleri ile belirlenmiştir.

$$L_u = \frac{100}{L} x \frac{Q}{h}$$

Lu	Lugeon değeri
Q	saniyede metre küp cinsinden enjeksiyon oranı (m^3/s)
h	metre cinsinden deney zonunda suyun basınç yüksekliği (m)
L	metre cinsinden deney zonunun uzunluğu (m)

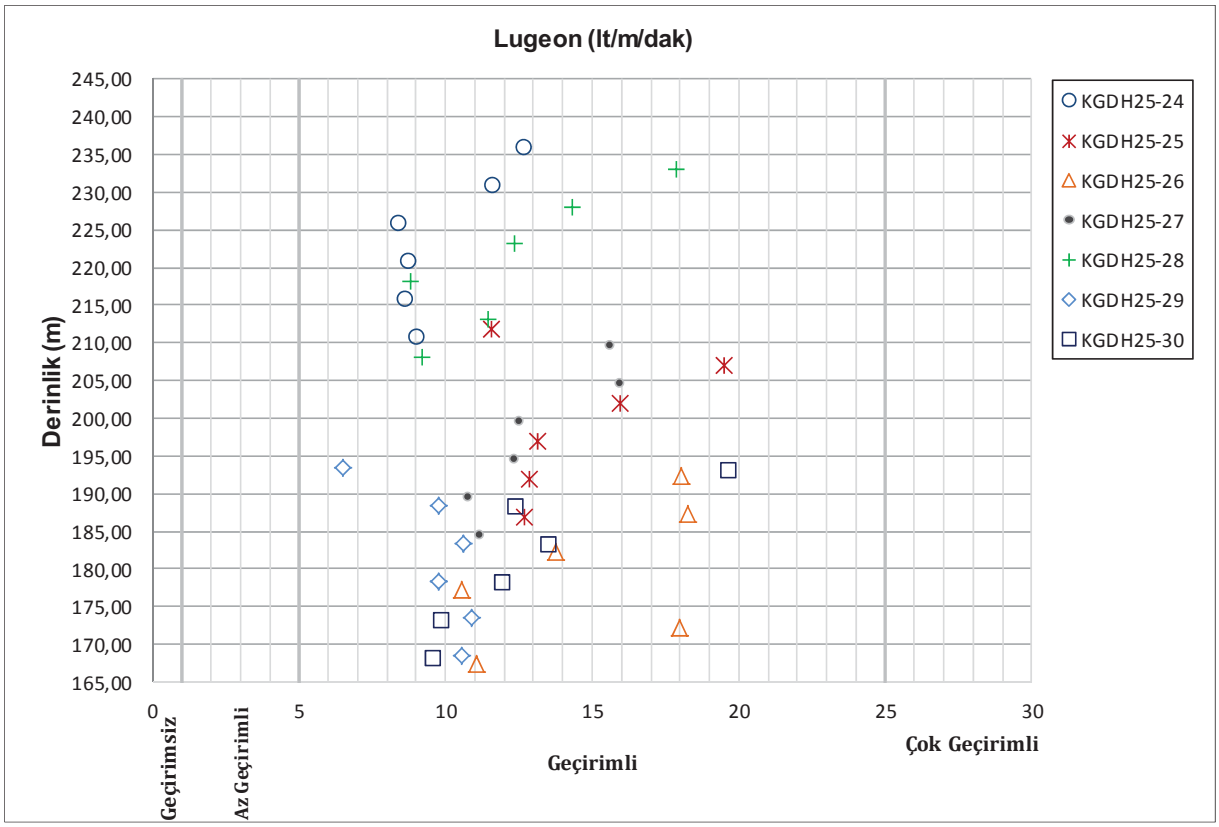
Kayalar Tablo 13'de verileni Lugeon değerlerine göre sınıflandırılmıştır..

Tablo 13. Lugeon değerlerine bağlı olarak kaya kütlesi geçirimliliğinin sınıflandırılması

Lugeon (l/dak/m)	Geçirimliliğin sınıflandırılması
0 – 1	Geçirimsiz
1 – 5	Az geçirimli
5 – 25	Geçirimli
> 25	Yüksek geçirimli

- **Atık Depolama Tesisi**

ADT yerinde yapılan 44 adet BST deneylerinin derinlikle değişimi Şekil 21, Şekil 22 ve Tablo 14'de verilmiştir. **Buna göre; ADT sahasının ana kayasını oluşturan Karakaya (TRkk) formasyonu birimleri Çamurtaşı-Kumtaşı ve Andezit tabakaları "Geçirimli" olarak sınıflandırılmıştır.**



Şekil 21 ADT İçin Lugeon Katsayısının Derinlikle Değişimi (Kotlu)

6.2.Laboratuvar Deneyleri

Proje dahilinde yapılan sondaj, araştırma çukuru ve blok numuneler üzerinde laboratuvar deneyleri bu bölümde sunulmuştur. Zemin numunelerinde tanımlama ve kayma direnci parametrelerinin tayini deneyleri yapılmış, kaya numunelerde ise dayanım ve mukavemet parametreleri belirlenmiştir. Laboratvar deneyleri aşağıda tablolarda özetlenmişolup deney föyleri Ek-4'de verilmiştir.

7. JEOLOJİK-JEOTEKNİK KOŞULLARIN DEĞERLENDİRİLMESİ

7.1.BİRİMLER

Jeoteknik davranış ve jeoteknik parametrelerle malzemeleri karakterize eden jeoteknik birim tanımlanmıştır. Jeoteknik birimlerin tanımı ve özellikleri aşağıda Tablo 26'da sunulmuştur.

Tablo 26 Jeoteknik birimler

Ünite Adı	Jeoteknik Birim	Derinlik (m)	Tanım	Jeoteknik Özellikler
Atık Depolama Tesisi	Birim 1: Çok-tamamen ayrışmış Karakaya Formasyonu (Kumtaşı-Andezit)	0,50 ila 4,00 m.ye kadar	koyu grimsi, çok-tamamen ayrışmış, her yönlü bir birini kesen süreksizliğin oluşturduğu zayıf kenetlenmiş kayaç parçalı, çok dar aralıklı, dalgalı-az pürüzlü, yoğun FeO ve kil sıvamalı, yer yer breşik yapıda	Gevşek ve duraysız malzeme. Yapı temeli için uygun değildir. Tamamen kaldırılmalı
	Birim 2: Taze-az ayrışmış Karakaya Formasyonu (Kumtaşı-Andezit)	Tabanda	bordo-koyu yeşil, iri taneli, az ayrışmış, her yönlü eklem sistemi, yakın-orta derece aralıklı, düzlemsel-basamaklı-pürüzlü, her yönlü <1,00 cm. kalınlığında düzensiz kalsit dolgulu, FeO sıvamalı, yer yer dağınık kuvars dağılımlı,	**Duraylı Malzeme:** Derin kazılarda, çok dar-dar aralıklı eklemlere dikkat edilmelidir. Yapı temeli için uygun.
Temiz Su Havuzu	Birim 1: Killi-Çakıllı KUM (Trkk)	2,50 m.ye kadar	Kahvemsi, kayaç parçalı, tamamen ayrışmış kumtaşı (KGDH25-22)	Gevşek ve duraysız malzeme. Yapı temeli için uygun değildir. Tamamen kaldırılmalı
	Birim 2: Taze-az ayrışmış Karakaya Formasyonu (Kumtaşı-Andezit)	Tabanda	bordo-koyu yeşil, iri taneli, az ayrışmış, her yönlü eklem sistemi, yakın-orta derece aralıklı, düzlemsel-basamaklı-pürüzlü, her yönlü <1,00 cm. kalınlığında düzensiz kalsit dolgulu, FeO sıvamalı, yer yer dağınık kuvars dağılımlı,	**Duraylı Malzeme:** Derin kazılarda, çok dar-dar aralıklı eklemlere dikkat edilmelidir. Yapı temeli için uygun.
Proses Tesis Alanı	Birim 1: Çok-tamamen ayrışmış Karakaya Formasyonu (Kumtaşı-Andezit)	Tüm profil boyunca	koyu grimsi, çok-tamamen ayrışmış, her yönlü bir birini kesen süreksizliğin oluşturduğu zayıf kenetlenmiş kayaç parçalı, çok dar aralıklı, dalgalı-az pürüzlü, yoğun FeO ve kil sıvamalı, yer yer breşik yapıda	Yapı temeli için uygun. Derin kazılarda, çok dar-dar aralıklı eklemlere dikkat edilmelidir.
Pasa Depolama Sahası	Birim 1: Çok-tamamen ayrışmış Karakaya Formasyonu (Kumtaşı-Andezit) ve Bitkisel Toprak	1,00 m.ye kadar		Yapı temeli için uygun değildir. Tamamen kaldırılmalı
	Birim 2: Taze-az ayrışmış Karakaya Formasyonu (Kumtaşı-Andezit)	Tabanda	bordo-koyu yeşil, iri taneli, az ayrışmış, her yönlü eklem sistemi, yakın-orta derece aralıklı, düzlemsel-basamaklı-pürüzlü, her yönlü <1,00 cm. kalınlığında düzensiz kalsit dolgulu, FeO sıvamalı, yer yer dağınık kuvars dağılımlı,	**Duraylı Malzeme:** Derin kazılarda, çok dar-dar aralıklı eklemlere dikkat edilmelidir. Yapı temeli için uygun.
Sızıntı Havuzu	Birim 2: Taze-az-orta ayrışmış Karakaya Formasyonu (Kumtaşı-Andezit)	Tabanda	bordo-koyu yeşil, iri taneli, az ayrışmış, her yönlü eklem sistemi, yakın-orta derece aralıklı, düzlemsel-basamaklı-pürüzlü, her yönlü <1,00 cm. kalınlığında düzensiz kalsit dolgulu, FeO sıvamalı, yer yer dağınık kuvars dağılımlı,	**Duraylı Malzeme:** Derin kazılarda, çok dar-dar aralıklı eklemlere dikkat edilmelidir. Yapı temeli için uygun.
Servis Alanı	Çakıl-Kıl KUM tamamen ayrışmış kumtaşı	1,50 m.ye kadar	Çok sıkı	Yapı temeli için uygun. Derin kazılarda, çok dar-dar aralıklı eklemlere dikkat edilmelidir.
	Birim 2: Taze-az ayrışmış Karakaya Formasyonu (Kumtaşı-Andezit)	Tabanda	bej renkli, ınce taneli, az ayrışmış, her yönlü eklem sıstem, orta derce-ğenıs aralıklı, düz-dalgalı-pürüzlü, yoğun FeO ve kil sıvamalı	Duraylı Malzeme: Derin kazılarda, çok dar-dar aralıklı eklemlere dikkat edilmelidir. Yapı temeli için uygun.

Kumtaşı (TRkk)

İnceleme alanında farklı ayrışma seviyelerinde görülen bu birim için ortalama jeoteknik parametreler aşağıda verilmiştir. Süreksizlik düzlemleri pürüzlü ve orta derece dayanımlıdır. Üst seviyelerde ve mostralarda oldukça bloklu yapıda ve yüksek seviye ayrışma gözlenmiştir. Sondaj verilerine göre 15,00m sonrasında birimin kalitesi artmaktadır (Şekil 33).

Şekil 33 Kumtaşı Mostrası

Andezit (TRkk)

Grimsi yer yer yeşilimsi- alacalı renkte gözlenmektedir. Formasyonun genel özelliği olarak bu birim de 15,00m 'ye kadar nispeten düşük kalitededir. Süreksizlik düzlemleri pürüzlü-dalgalı bazen de düzlemseldir.

7.1.1. KARAKAYALAR FORMASYONU (TRKK) İÇİN DEĞERLENDİRME

Proje sahasında, yapımı planlanan üniteler sahasında rastlanılan Karakaya formasyonu (TRkk) kaya kütlelerinin tasarım parametreleri masif kayanın laboratuvarda elde edilen fiziksel ve mekanik özellikleri ila görgül kaya kütle sınıflamalarından elde edilen ampirik eşitliklerden saptanmıştır.

Bu bölümde kaya kütlesinin tasarım parametrelerine yönelik ampirik eşitliklerde kullanılacak olan girdi (input) parametreleri anlatılacaktır.

Girdi parametreleri aşağıda özetlenmiştir.

a-Tek eksenli dayanım (UCS), Doğal Birim hacim ağırlığı (γn), Masif kayanın elastisite modülü (E_i)

b-Kaya Kalite Tanımı (RQD)

c-Süreksizlik Durumu Özgü Sınıflama(Version 89)

d-Jeolojik dayanım indeksi (GSI)

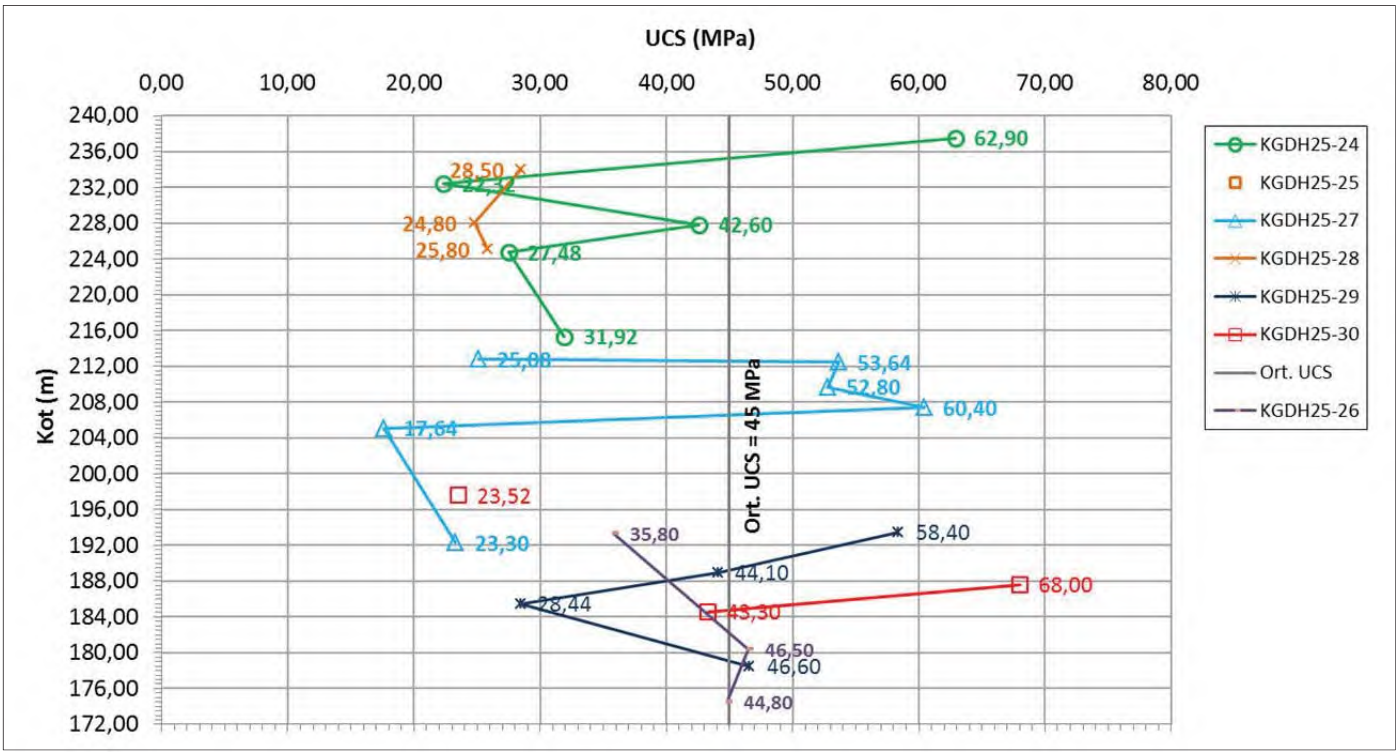
e-Hoek & Brown sabiti (mi)

a-Tek eksenli dayanım (UCS), Doğal Birim hacim ağırlığı (γn), Masif kayanın elastisite modülü (E_i)

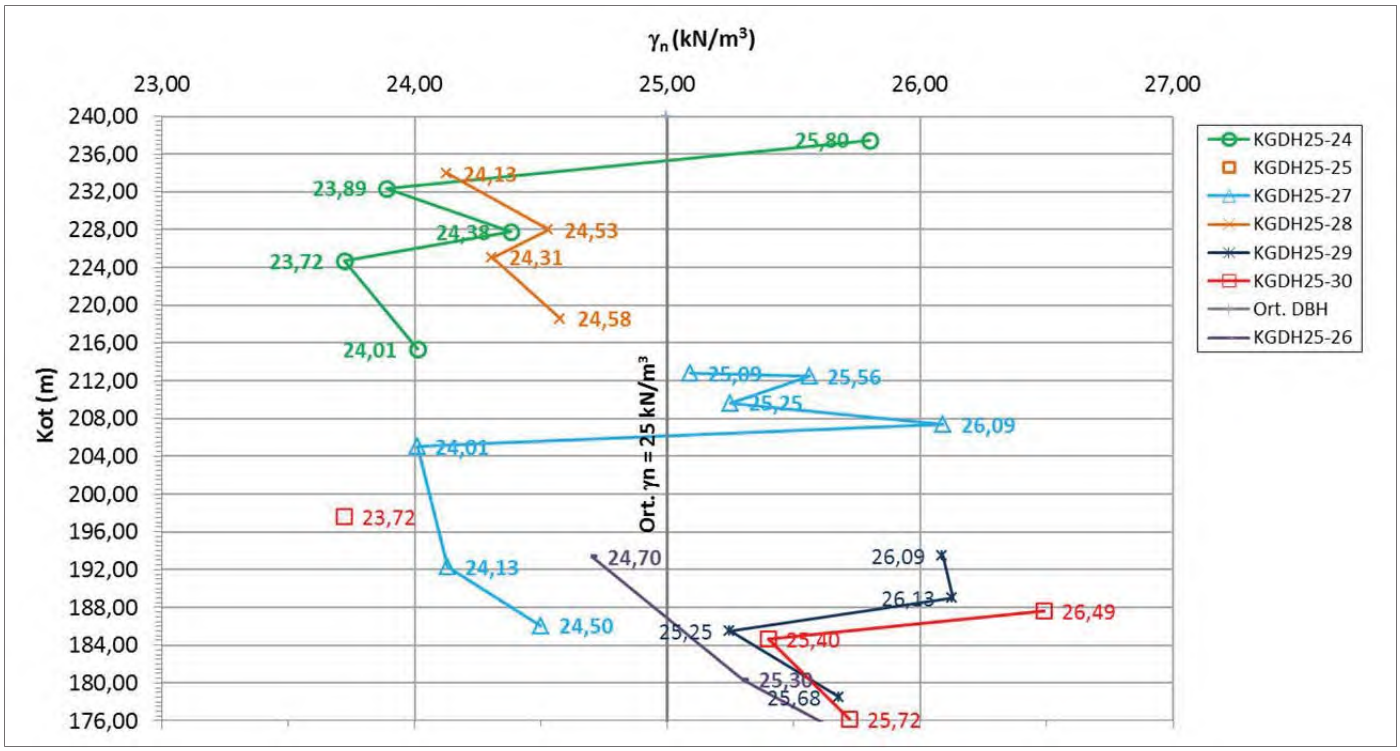
- **Atık Depolama Tesisi**

Karakaya formasyonu (TRkk) tabakasından alınan karot numuneleri üzerinde yapılan deneyler Tablo14 ve derinlikle değişimi Şekil 34, Şekil 35 ve Şekil 36'da verilmiştir.

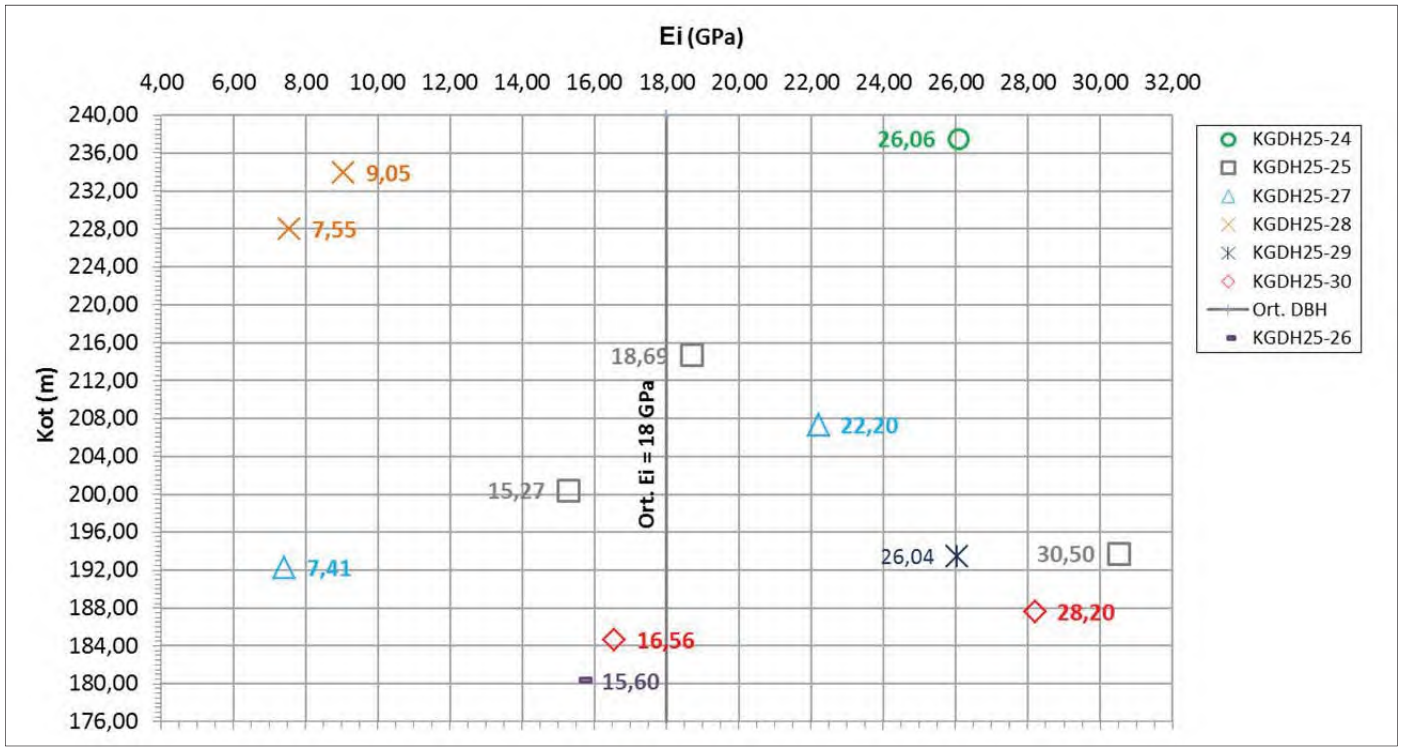
Buna göre; Atık depolama tesisi sahası ana kayasını oluşturan, Karakaya formasyonu (TRkk) için UCS = 45 MPa, γ_n = 25 kN/m^3, Ei = 18 GPa olarak bulunmuştur.



Şekil 34 . ADT Tek Eksenli Basınç Değerlerinin Derinlikle Değişimi



Şekil 35 . ADT Doğal Birim Hacim Ağırlığı Değerlerinin Derinlikle Değişimi

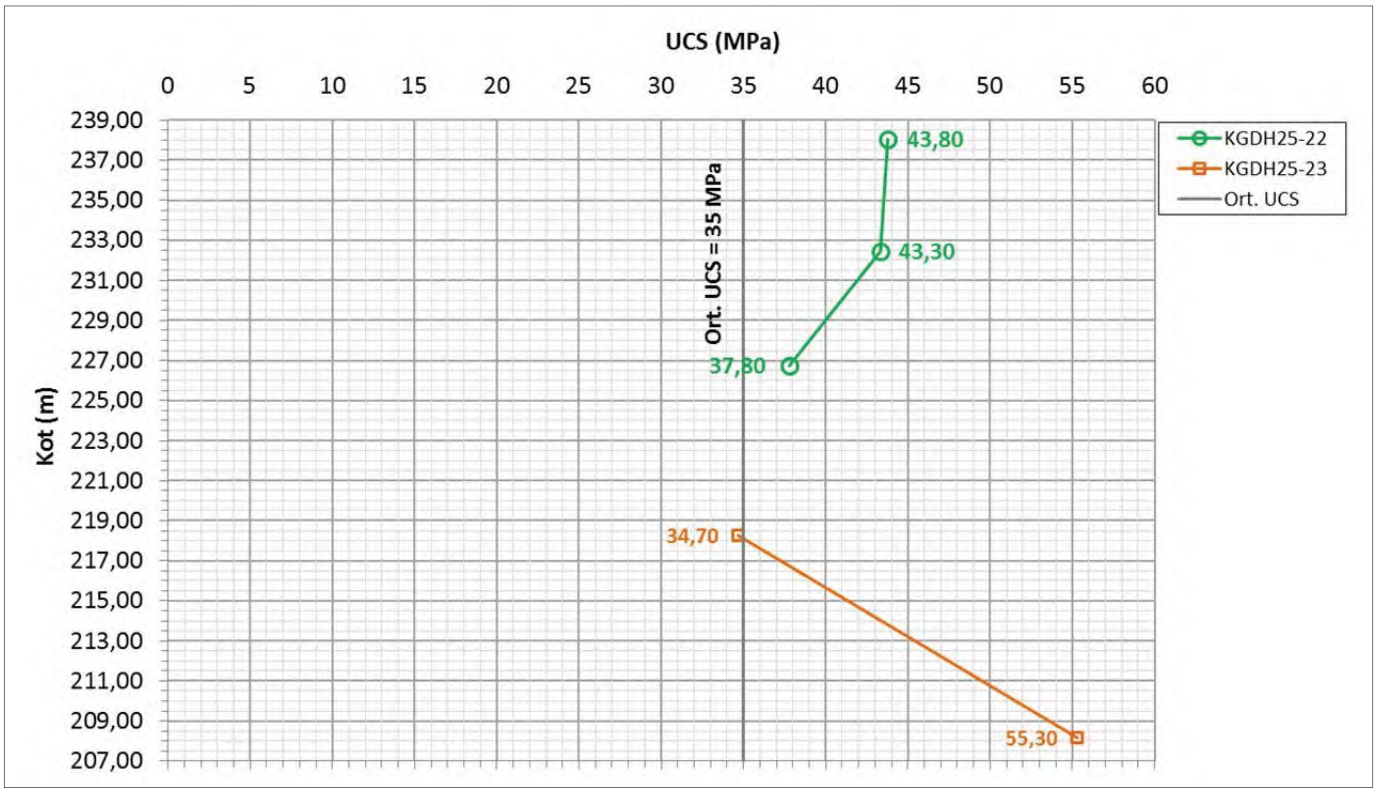


Şekil 36 . ADT Elastisite Modülü Değerlerinin Derinlikle Değişimi

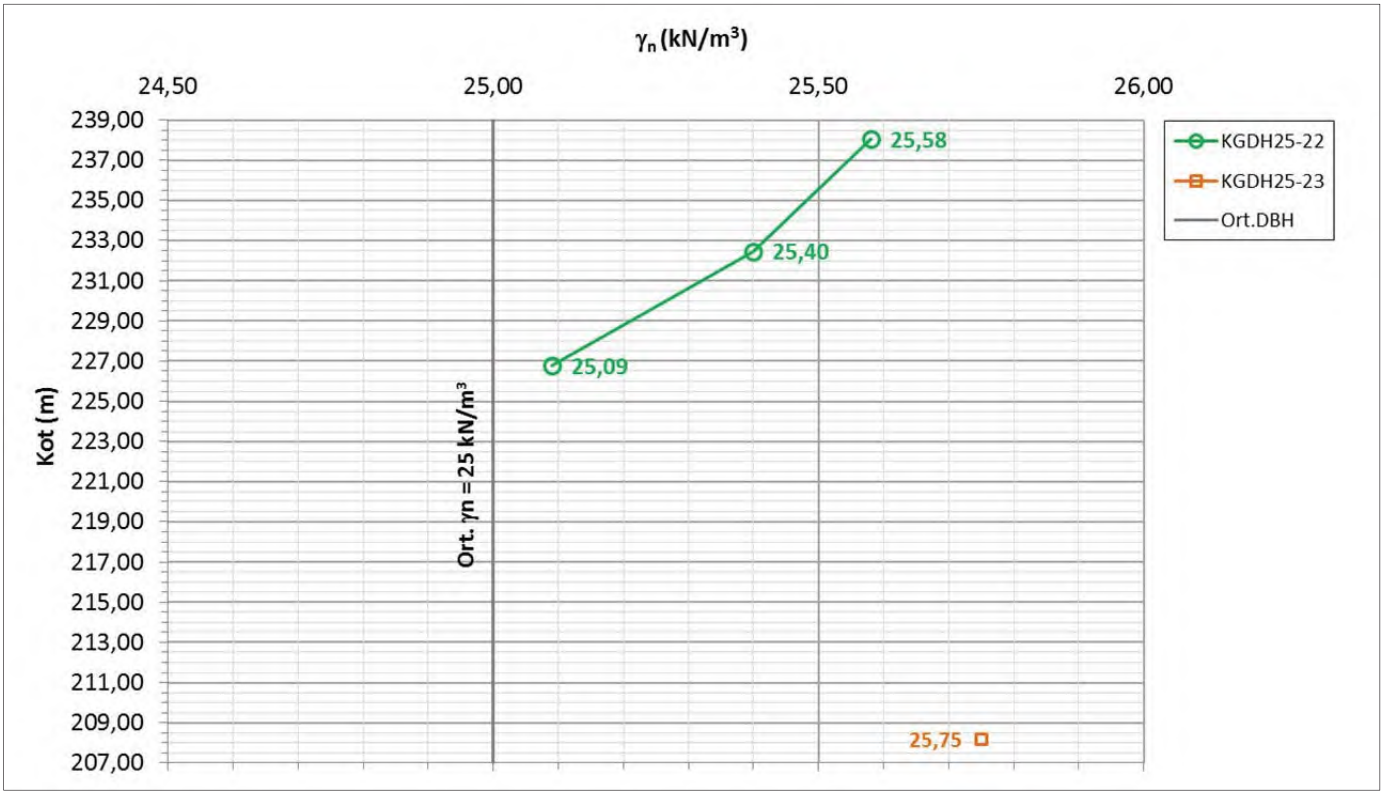
➢ **Temiz Su Havuzu**

Karakaya formasyonu (TRkk) tabakasından alınan karot numuneleri üzerinde yapılan deneyler Tablo21 ve derinlikle değişimi Şekil 37, Şekil 38 ve Şekil 39'da verilmiştir.

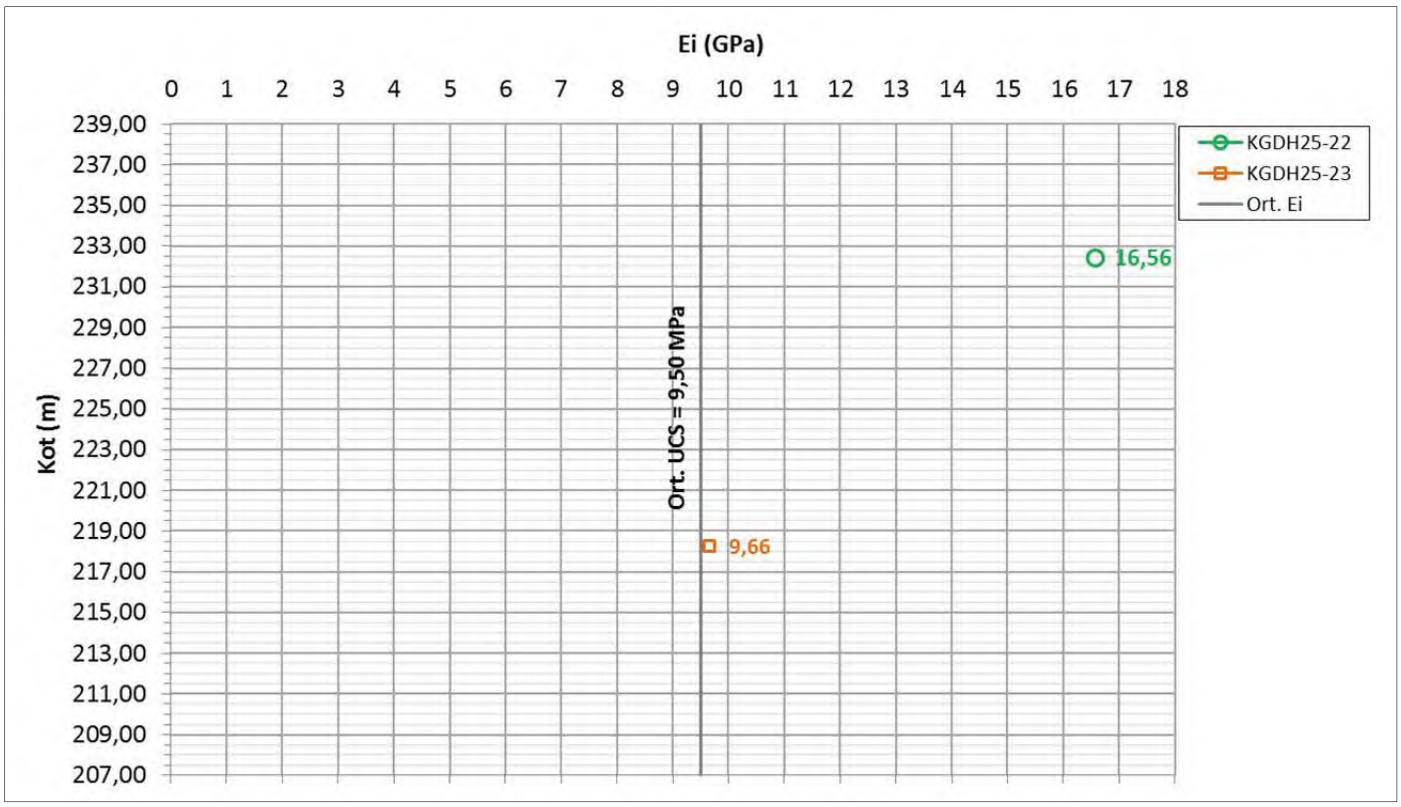
Buna göre; Temiz su havuzu sahası ana kayasını oluşturan, Karakaya formasyonu (TRkk) için UCS = 35 MPa, γ_n = 25 kN/m^3, Ei = 9,50 GPa olarak bulunmuştur.



Şekil 37 . Temiz Su Havuzu Tek Eksenli Basınç Değerlerinin Derinlikle Değişimi



Şekil 38 . Temiz Su Havuzu Doğal Birim Hacim Ağırlığı Değerlerinin Derinlikle Değişimi

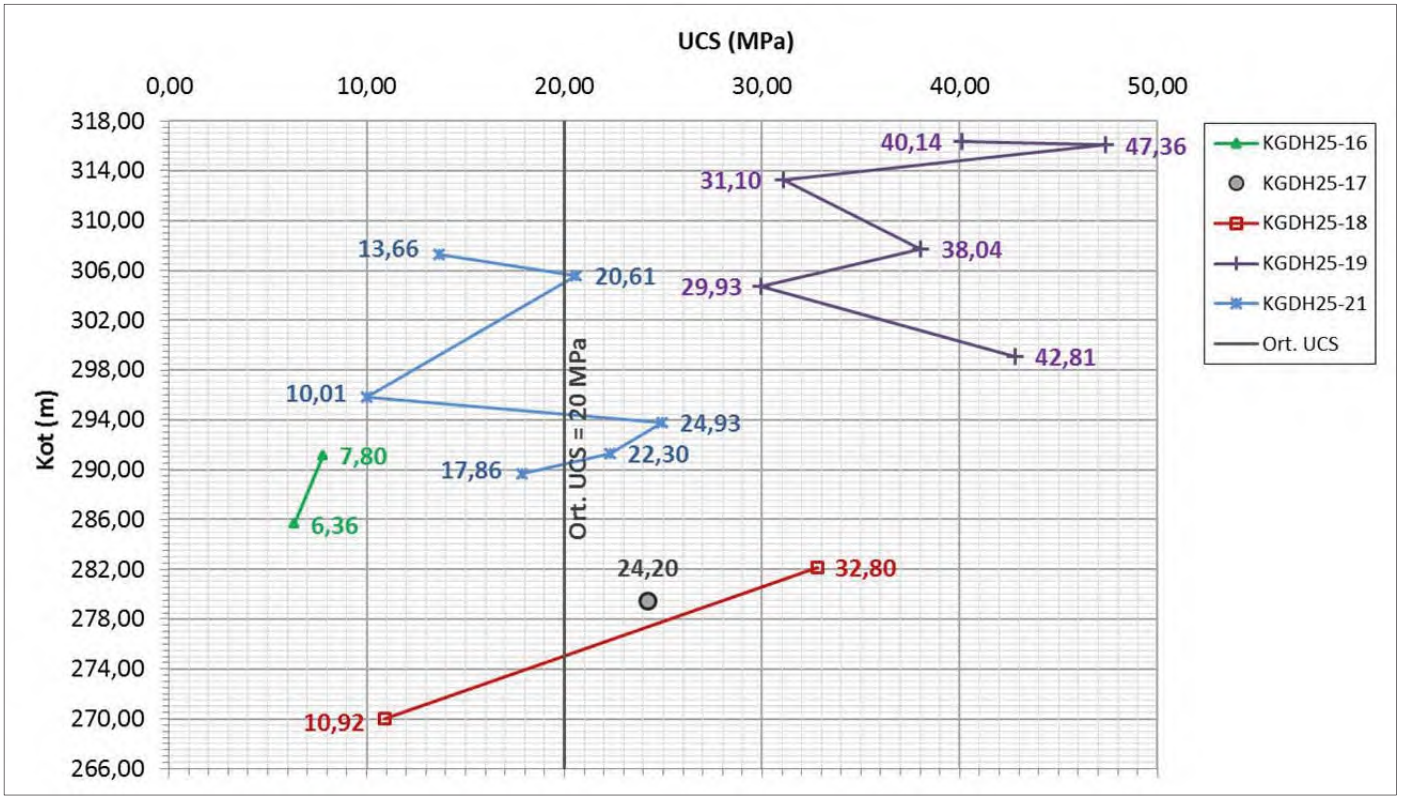


Şekil 39 . Temiz Su Havuzu Elastisite Modülü Değerlerinin Derinlikle Değişimi

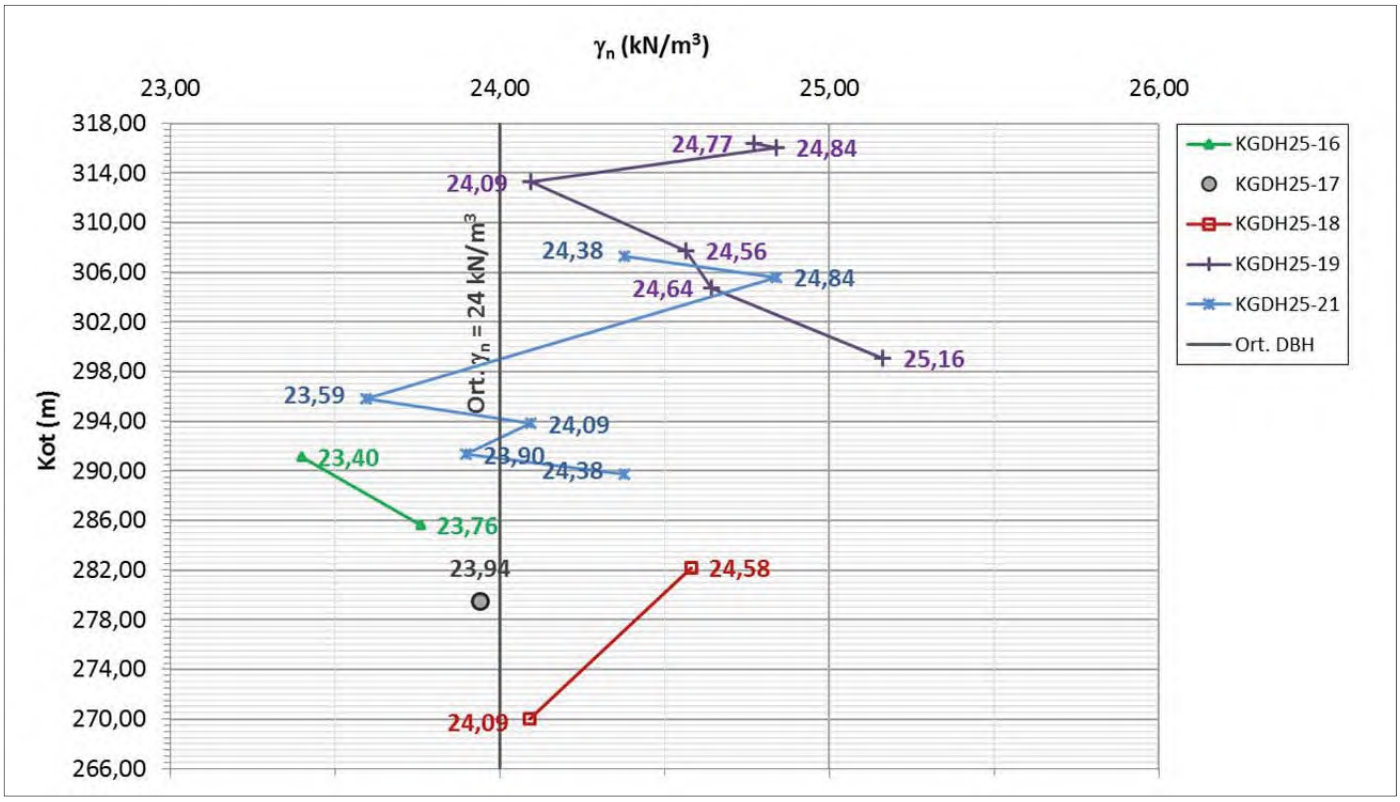
➢ **Proses Tesis Sahası**

Karakaya formasyonu (TRkk) tabakasından alınan karot numuneleri üzerinde yapılan deneyler Tablo24 ve derinlikle değişimi Şekil 40, Şekil 41 ve Şekil 42'de verilmiştir.

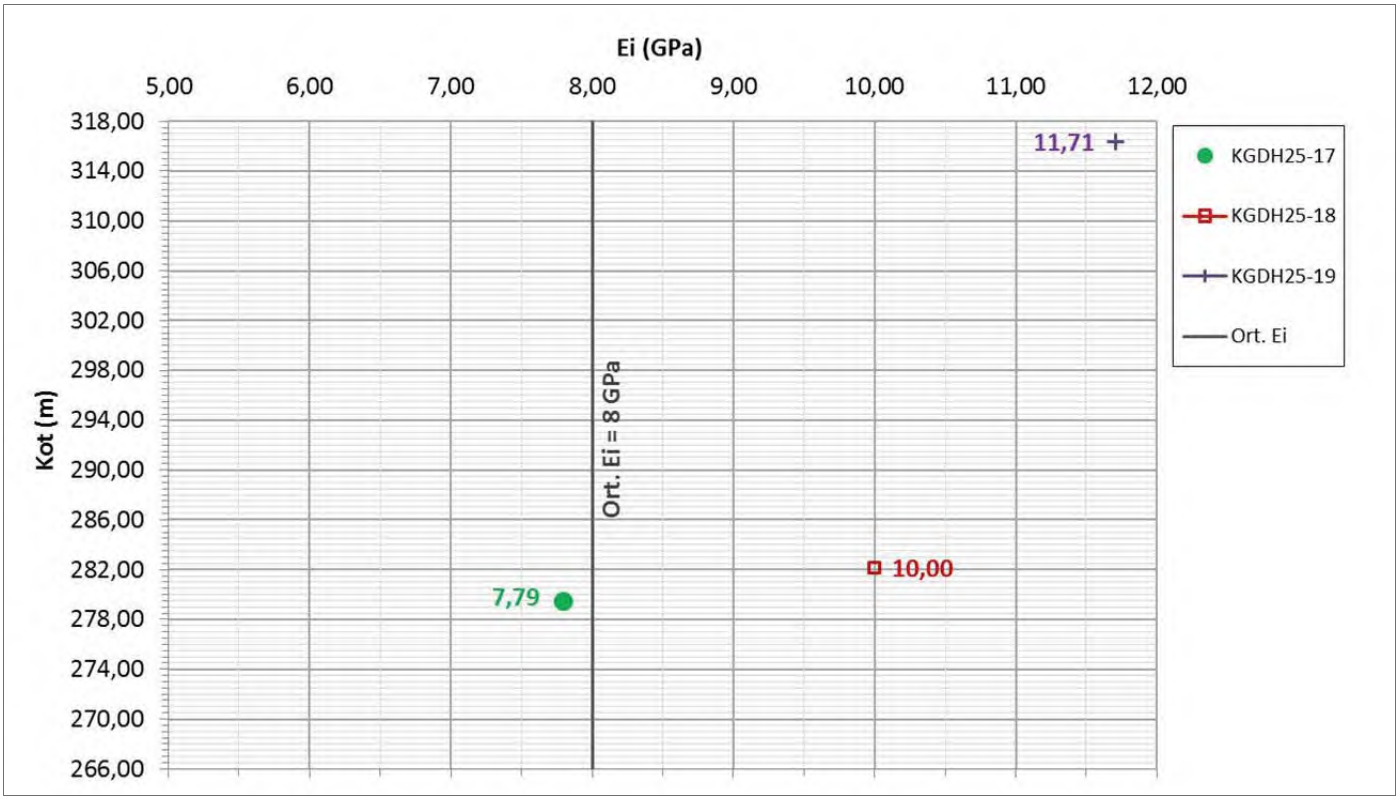
Buna göre; Proses tesis sahası ana kayasını oluşturan, Karakaya formasyonu (TRkk) için UCS = 20 MPa, γ_n = 24,0 kN/m^3, Ei = 9,50 GPa olarak bulunmuştur.



Şekil 40 . Proses Tesis Sahası Tek Eksenli Basınç Değerlerinin Derinlikle Değişimi



Şekil 41 . Proses Tesis Sahası Doğal Birim Hacim Ağırlığı Değerlerinin Derinlikle Değişimi

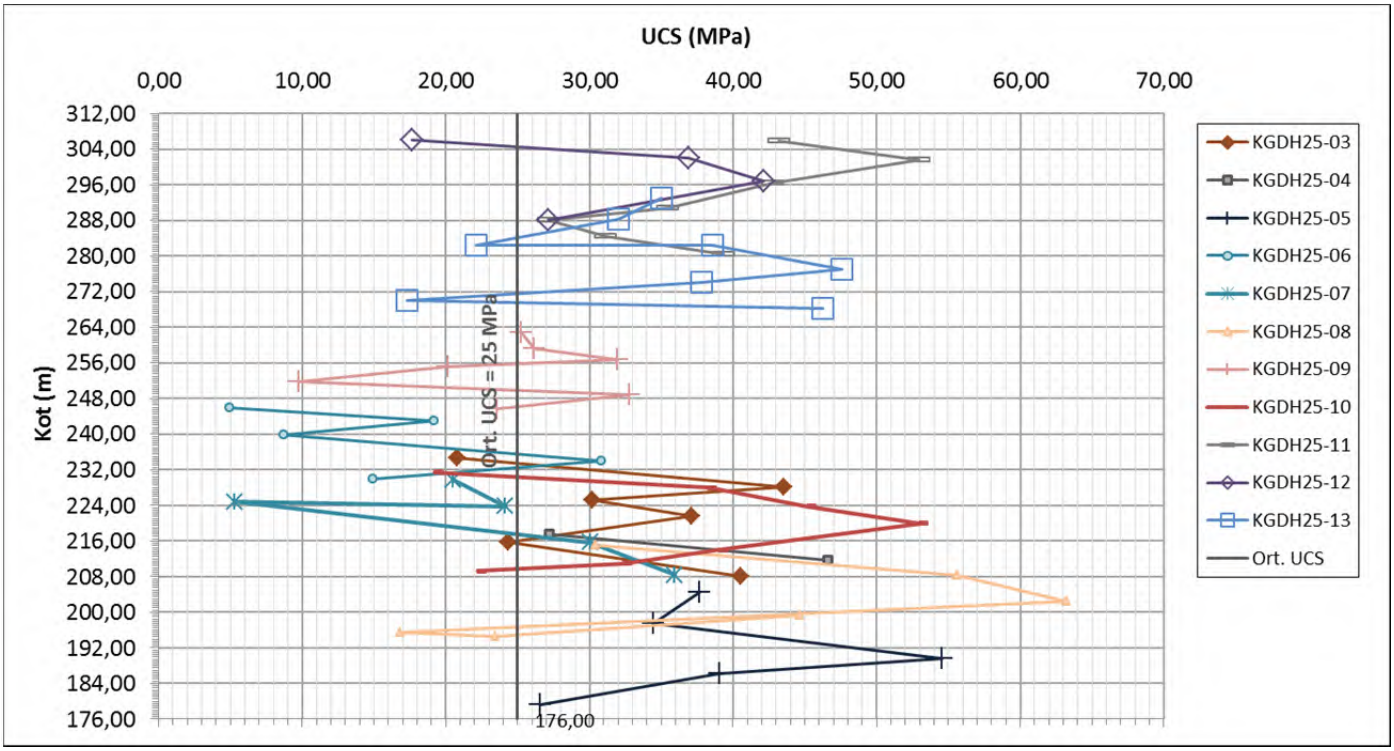


Şekil 42 . Proses Tesis Sahası Elastisite Modülü Değerlerinin Derinlikle Değişimi

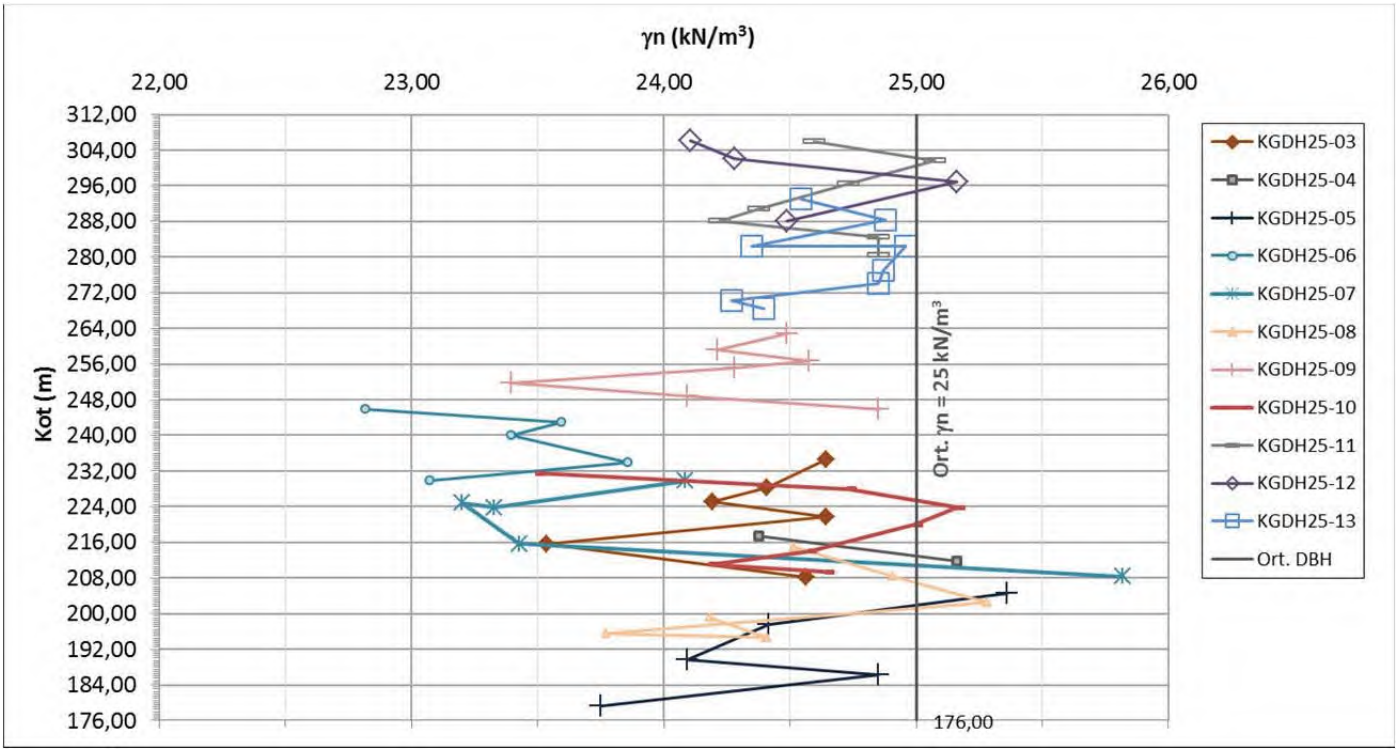
➢ **Pasa Depolama Sahası**

Karakaya formasyonu (TRkk) tabakasından alınan karot numuneleri üzerinde yapılan deneyler Tablo25 ve derinlikle değişimi Şekil 43, Şekil 44 ve Şekil 45'de verilmiştir.

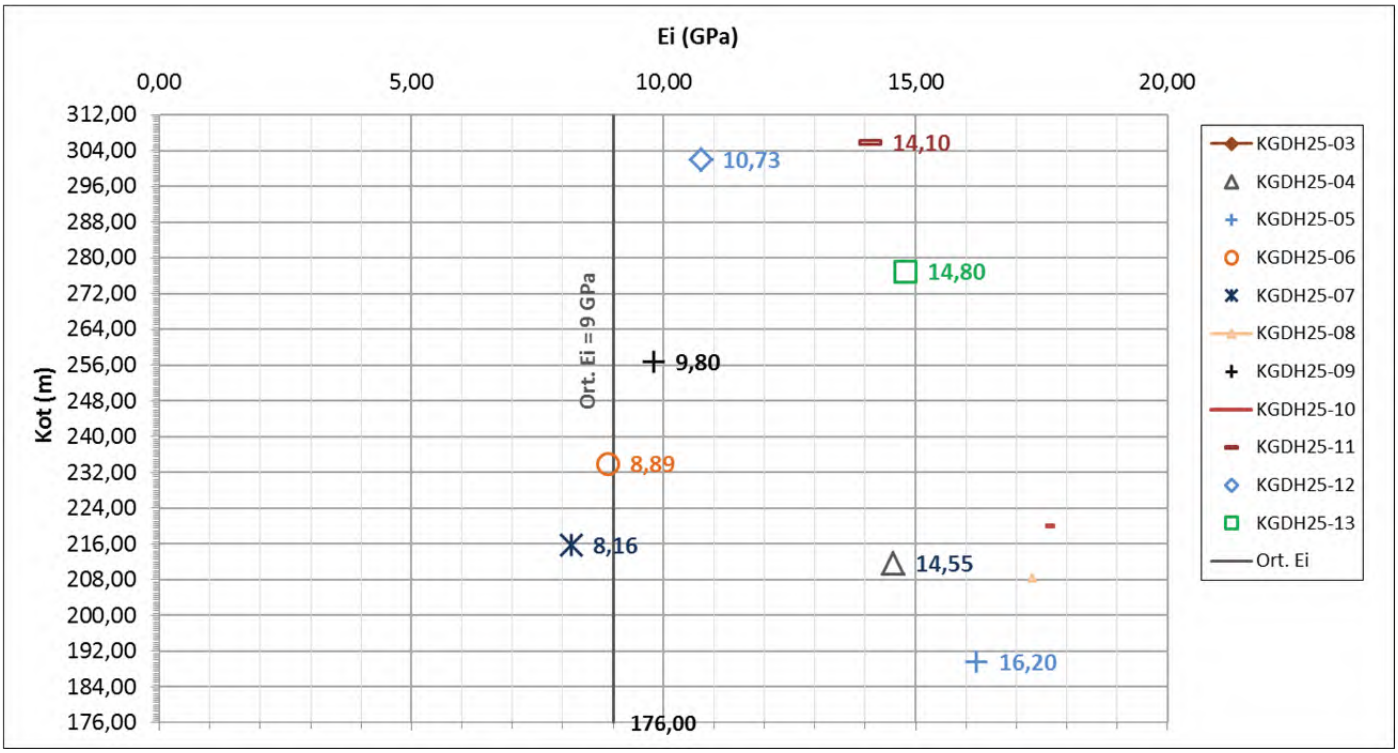
Buna göre; Pasa depolama sahası ana kayasını oluşturan, Karakaya formasyonu (TRkk) için UCS = 25 MPa, γ_n = 25 kN/m^3, Ei = 9,50 GPa olarak bulunmuştur.



Şekil 43 . Pasa Depolama Sahası Tek Eksenli Basınç Değerlerinin Derinlikle Değişimi



Şekil 44 . Pasa Depolama Sahası Doğal Birim Hacim Ağırlığı Değerlerinin Derinlikle Değişimi

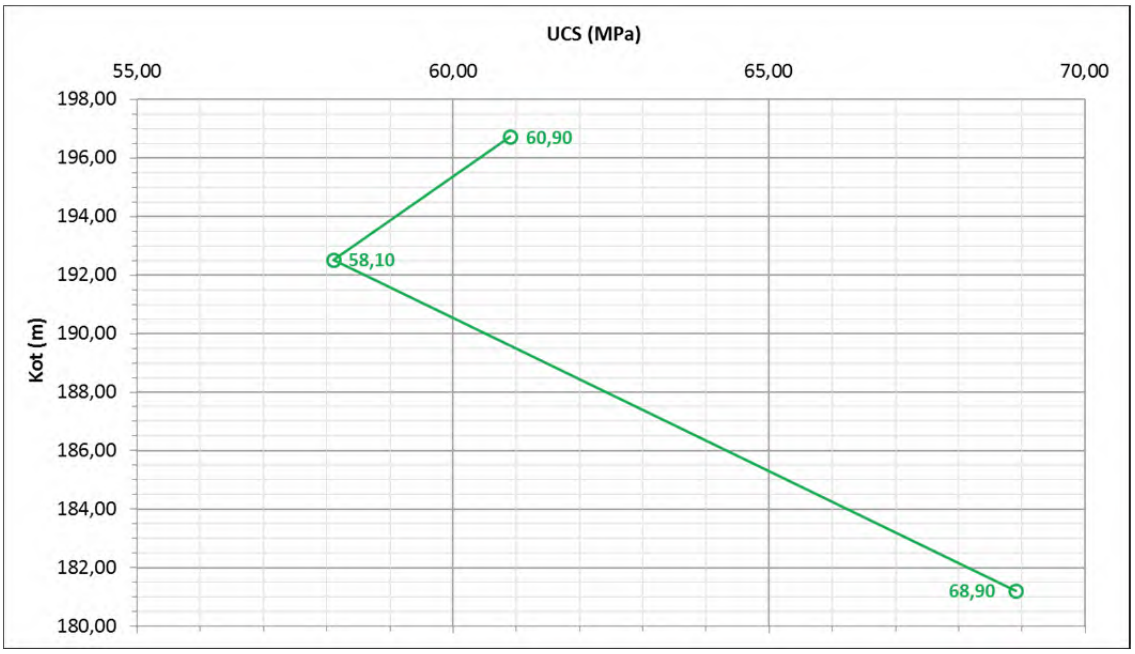


Şekil 45 . Pasa Depolama Elastisite Modülü Değerlerinin Derinlikle Değişimi

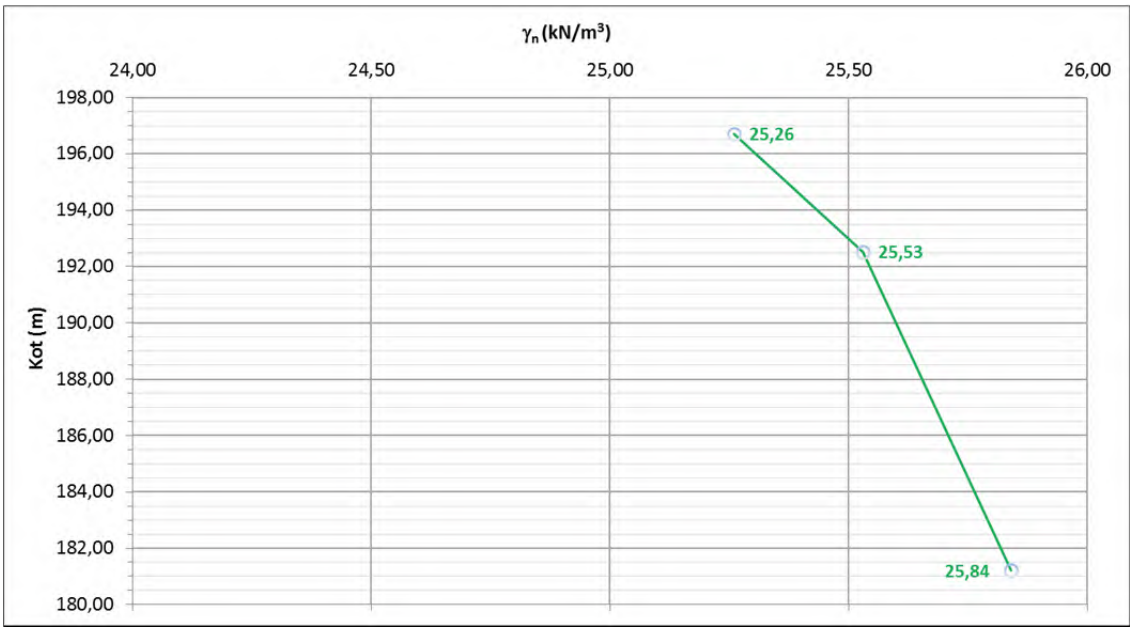
➢ **Sızıntı Havuzu**

Karakaya formasyonu (TRkk) tabakasından alınan karot numuneleri üzerinde yapılan deneyler Tablo23 ve derinlikle değişimi Şekil 46 ve Şekil 47'de verilmiştir.

Buna göre; Sızıntı havuzu sahası ana kayasını oluşturan, Karakaya formasyonu (TRkk) için UCS = 58 MPa, γ_n = 25,5 kN/m^3, Ei = 19,58 GPa olarak bulunmuştur.



Şekil 46 . Sızıntı Havuzu Tek Eksenli Basınç Değerlerinin Derinlikle Değişimi

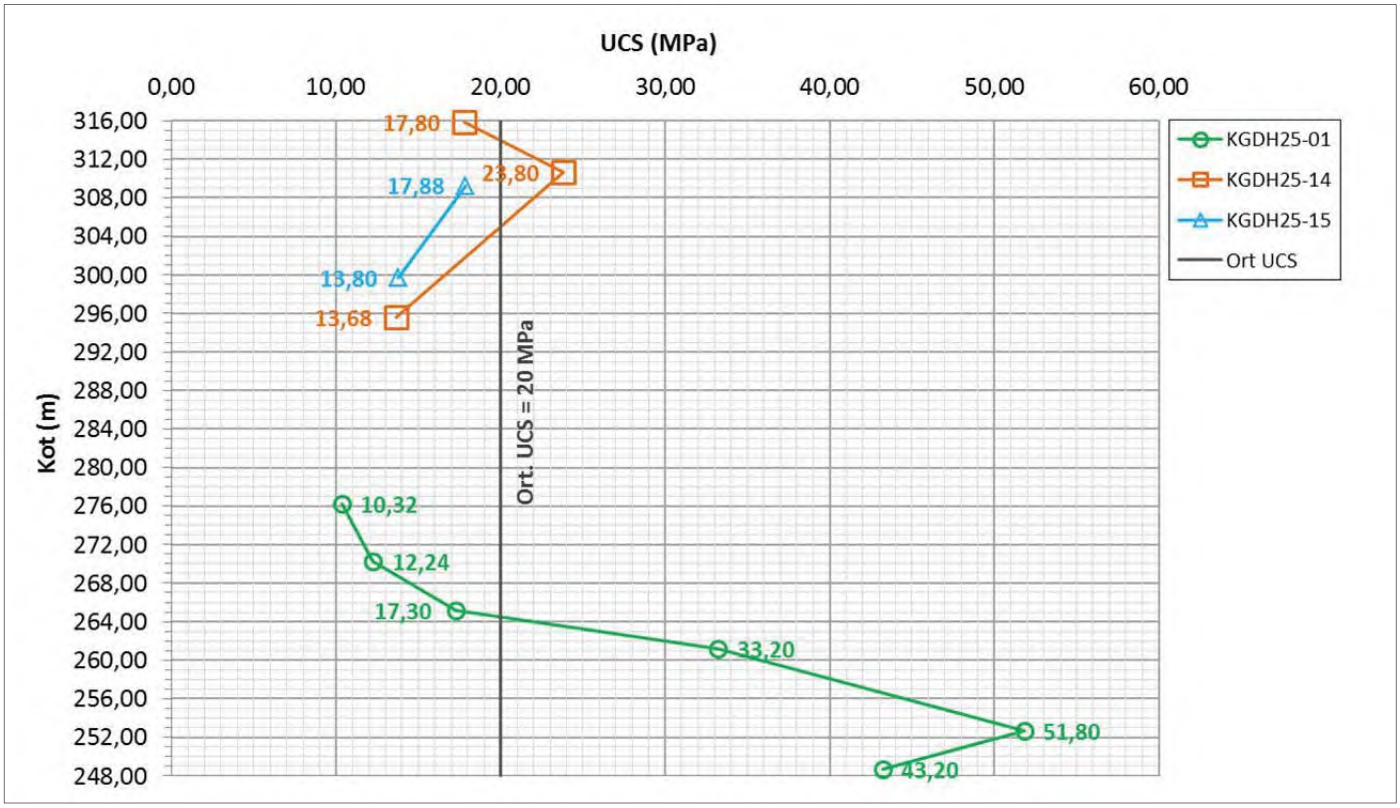


Şekil 47 . Sızıntı Havuzu Doğal Birim Hacim Ağırlığı Değerlerinin Derinlikle Değişimi

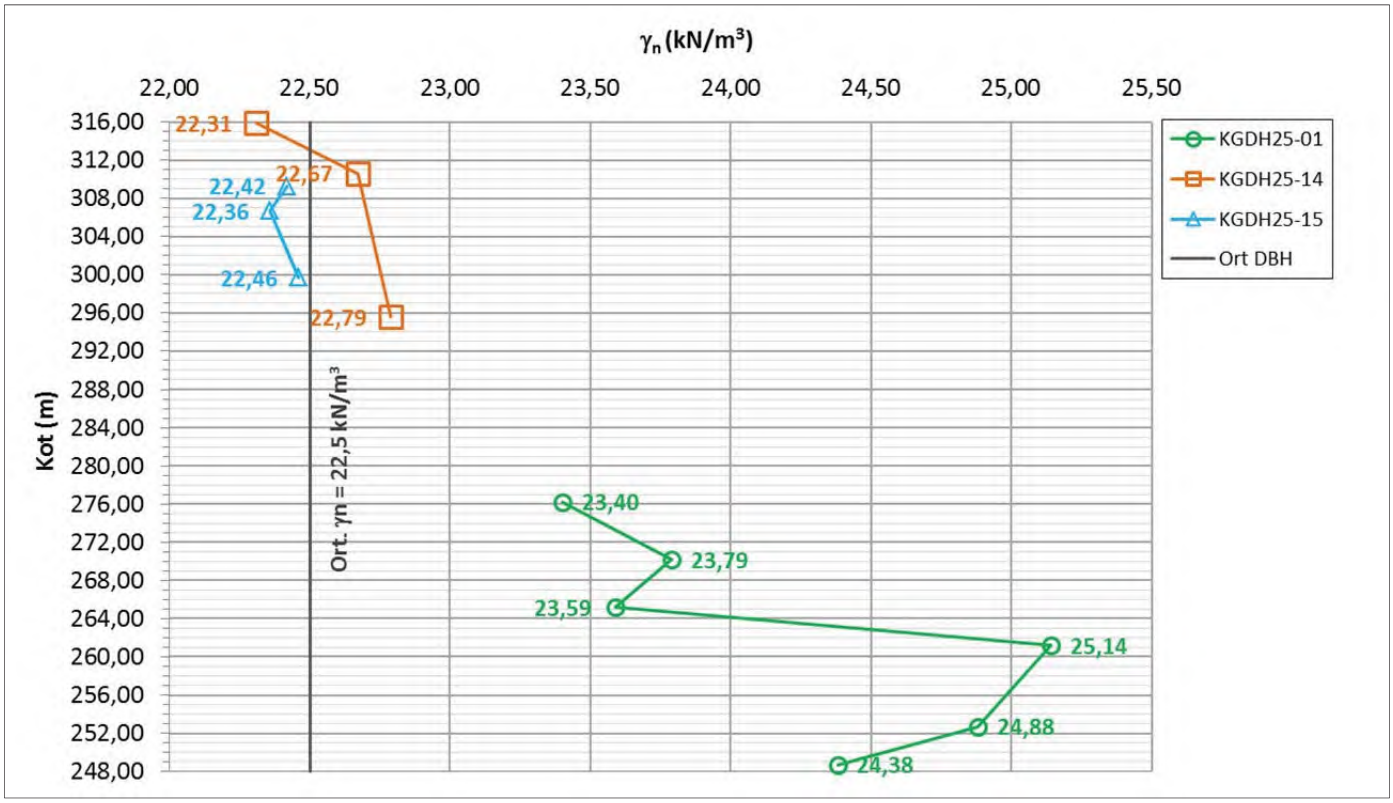
➢ **Servis Alanı**

Karakaya formasyonu (TRkk) tabakasından alınan karot numuneleri üzerinde yapılan deneyler Tablo22 ve derinlikle değişimi Şekil 48, Şekil 49 ve Şekil 50'de verilmiştir.

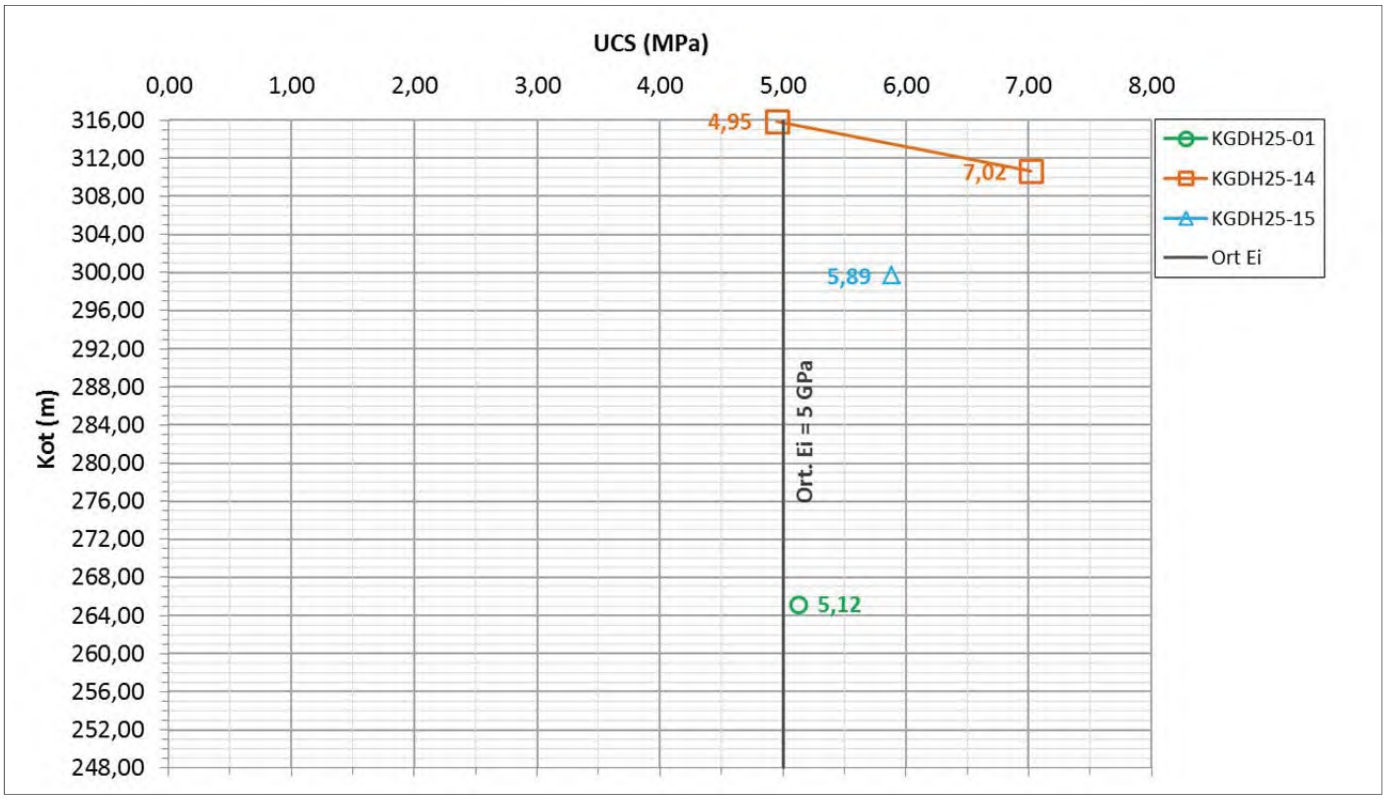
Buna göre; Servis alanı ana kayasını oluşturan, Karakaya formasyonu (TRkk) için UCS = 20 MPa, γ_n = 22,5 kN/m^3, Ei = 5,00 GPa olarak bulunmuştur.



Şekil 48 . Servis Alanı Tek Eksenli Basınç Değerlerinin Derinlikle Değişimi



Şekil 49 . Servis Alanı Doğal Birim Hacim Ağırlığı Değerlerinin Derinlikle Değişimi



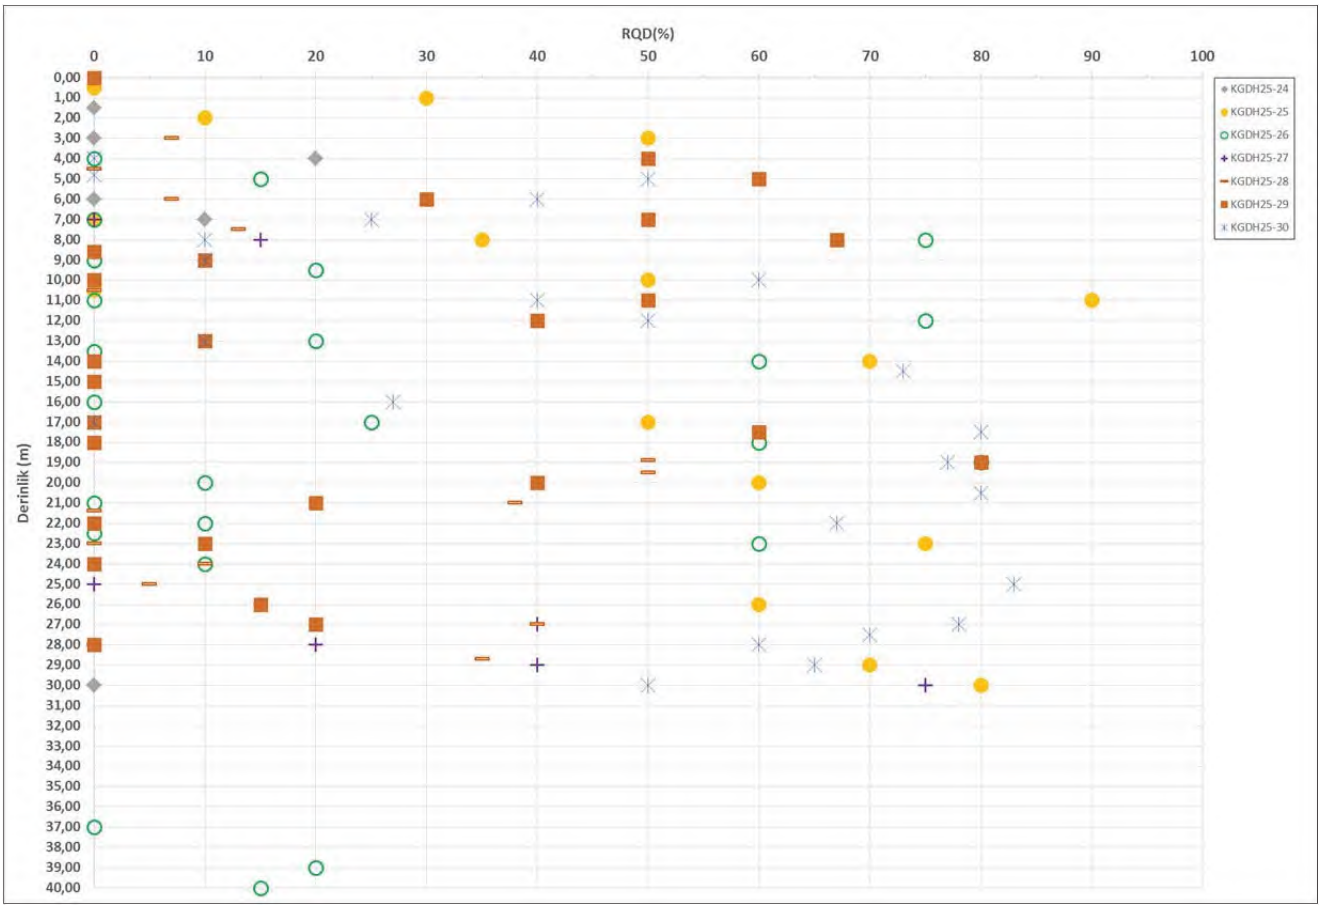
Şekil 50 . Servis Alanı Elastisite Modülü Değerlerinin Derinlikle Değişimi

b-Kaya Kalite Tanımı, RQD

Kaya ortamının çatlaklığının sayısal olarak tarifleyen RQD değerleri, tektonik koşullar, orijinal litoloji, ayrışma durumu ve kaya ortamının dayanımı açısından önemli bir ölçüttür. Çalışma sahasında yer alan, kaya formasyonlarının kıvrımlı-kırıklı yapısı nedeniyle, tıpkı GSI değerlerinde olduğu gibi, sondajın kaya ortamındaki tüm derinliği boyunca her karot örneği için RQD değerleri belirlenmiş, sondaj bazında manevra boyuna bağlı olarak ağırlıklı ortamalar hesaplanmıştır.

- **Atık Depolama Tesisi**

Atık depolama tesisi, ana kayasının ((TRkk), Şekil 51 ve Tablo 27'de verilen RQD değerlendirmesine göre ağırlıkça **ortalama RQD %'si ~25** olarak alınmıştır.



Şekil 51 . Atık Depolama Tesisi Karakaya formasyonu (TRkk) RQD Değerlerinin Derinlikle Değişimi

➢ ***Süreksizlik Durumu Özgü Sınıflama(Version 89)***

Proje sahasında planlanan üniteler için $JCond_{89}$ puanları Tablo 33'e göre;

Atık depolama tesisi, temiz su havuzu ve servis alanı ~ 20

Sızıntı havuzu ~ 23

Pasa depolama sahası için ~ 22

Proses Sızıntı havuzu için ~ 12

olarak hesaplanmıştır.

Tablo 33. Süreksizlik Durumuna Özgü Sınıflama (Version 89)

Süreksizlik Uzunluğu	< 1 m	1 - 3 m	3 - 10 m	10 - 20 m	> 20 m
Değerlendirme	6	4	2	1	0
Açıklık	Yok	< 0.1 mm	0.1 - 1.0 mm	1 - 5 mm	> 5 mm
Değerlendirme	6	5	4	1	0
Pürüzlülük	Çok Pürüzlü	Pürüzlü	Az Pürüzlü	Pürüzsüz	Cilalı Yüzlü
Değerlendirme	6	5	3	1	0
Dolgu	Yok	Sert Dolgu < 5 mm	Sert Dolgu > 5 mm	Yumuşak Dolgu < 5 mm	Yumuşak Dolgu > 5 mm
Değerlendirme	6	4	2	2	0
Ayrışma	Taze	Az Ayrışmalı	Orta Ayrışmalı	Çok Ayrışmalı	Bütünüyle Ayrışmalı
Değerlendirme	6	5	3	1	0

Atık Depolama Tesisi / Temiz Su Havuzu		Pasa Depolama Sahası			
Proses Tesis alanı		Sızıntı Havuzu		Servis Alanı	

➢ **Jeolojik Dayanım İndeksi (GSI)**

Kayalar küçük ölçekte dikkate alındıklarında kaya malzemesi önem kazanırken, ölçek büyüdüğünde sağlam kaya malzemesinden eklemli kaya kütlesine geçiş söz konusudur. Farklı yönelimlerde gelişmiş çok sayıdaki süreksizlik tarafından bölünmüş kaya kütlelerinin davranışı, kaya malzemesinin aksine, hem süreksizlikler, hem de kaya malzemesi tarafından denetlenir. Dolayısıyla kaya kütlelerinin dayanım ve deformasyon özelliklerinin, kaya malzemesiyle birlikte süreksizlikleri de içerecek boyutlardaki örnekler üzerinde tayin edilmesi gerekir. Ancak bu tür ortamlardan, kaya malzemesi ile birlikte süreksizlikleri de içeren ve metre boyutuna ulaşan örneklerin alınması ve bunların laboratuvar deneyleri için hazırlanmaları mümkün olmadığı gibi, bu boyuttaki örnekler için laboratuvarda kullanılabilecek büyük deney hücreleri de geliştirilmemiştir.

Bu sınırlamalar, araştırmacıları kaya kütlelerinin dayanım ve deformasyon özelliklerinin daha pratik şekilde belirlenebileceği yöntemlerin geliştirilmesine zorlamıştır.

Seksenli yılların başında geliştirilen ve günümüze değin bazı değişikliklere de uğrayan Hoek-Brown yenilme ölçütü görgül bir ölçüt olup, kaya kütlelerinin dayanımının belirlenmesiyle ilgili söz konusu sınırlamaları önemli ölçüde gidermiş ve son 20 yıl içinde kaya mekaniği bilim dalındaki ilgi çekici gelişmelerden biri olmuştur (Ulusay ve Sönmez, 2007).

Bununla beraber Dr. Hoek 2013 yılında tecrübeli jeolog / jeoloji mühendislerinin GSI bulunmadığı durumlarda GSI değerini saptamak için bir sayısallaştırma yöntemi yani aynı araştırmacı tarafından geliştirilmiş ve 2013 yılında yayımlanmıştır (Hoek, 2011).

Şekil 57, 58, 59, 60 ve Şekil 61'de bu sayısallaştırma işleminde RMR ve Q sistemleri baz alınmış ve RQD ile korole edilmiştir.

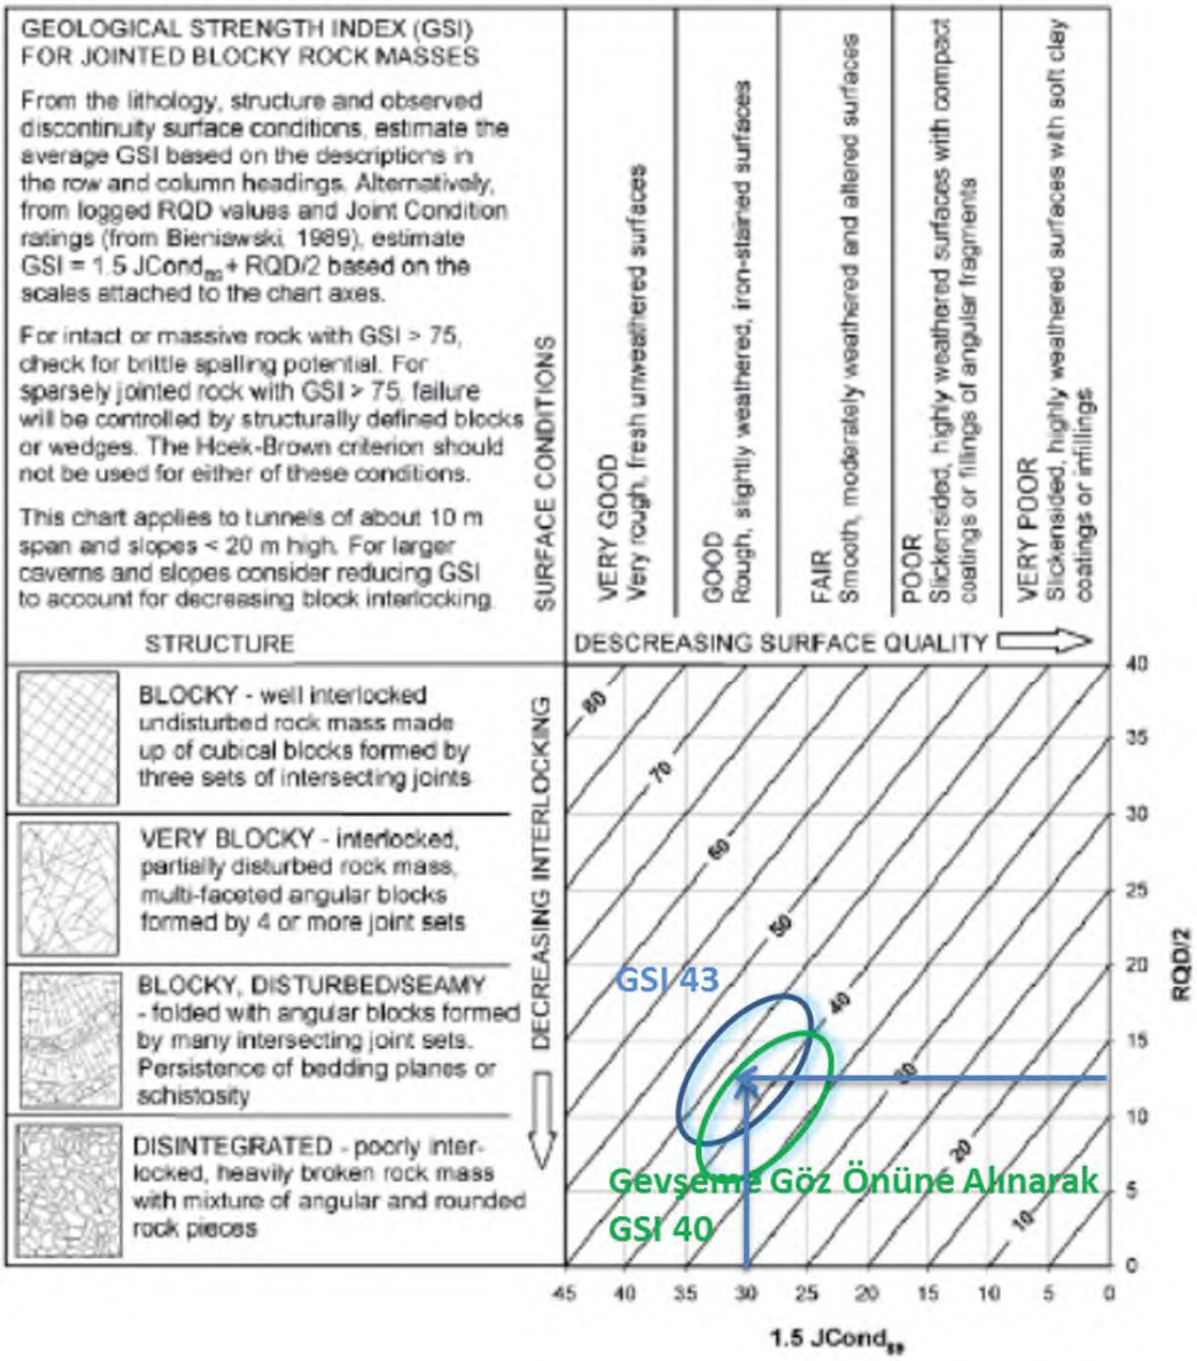
Buna göre ünite sahalarının ana kayasını oluşturan Karakaya formasyonu (TRkk) için jeolojik dayanım indeksi (GSI) aşağıdaki eşitliklerden;

$GSI = 1{,}5JCond_{89} + RQD/2$

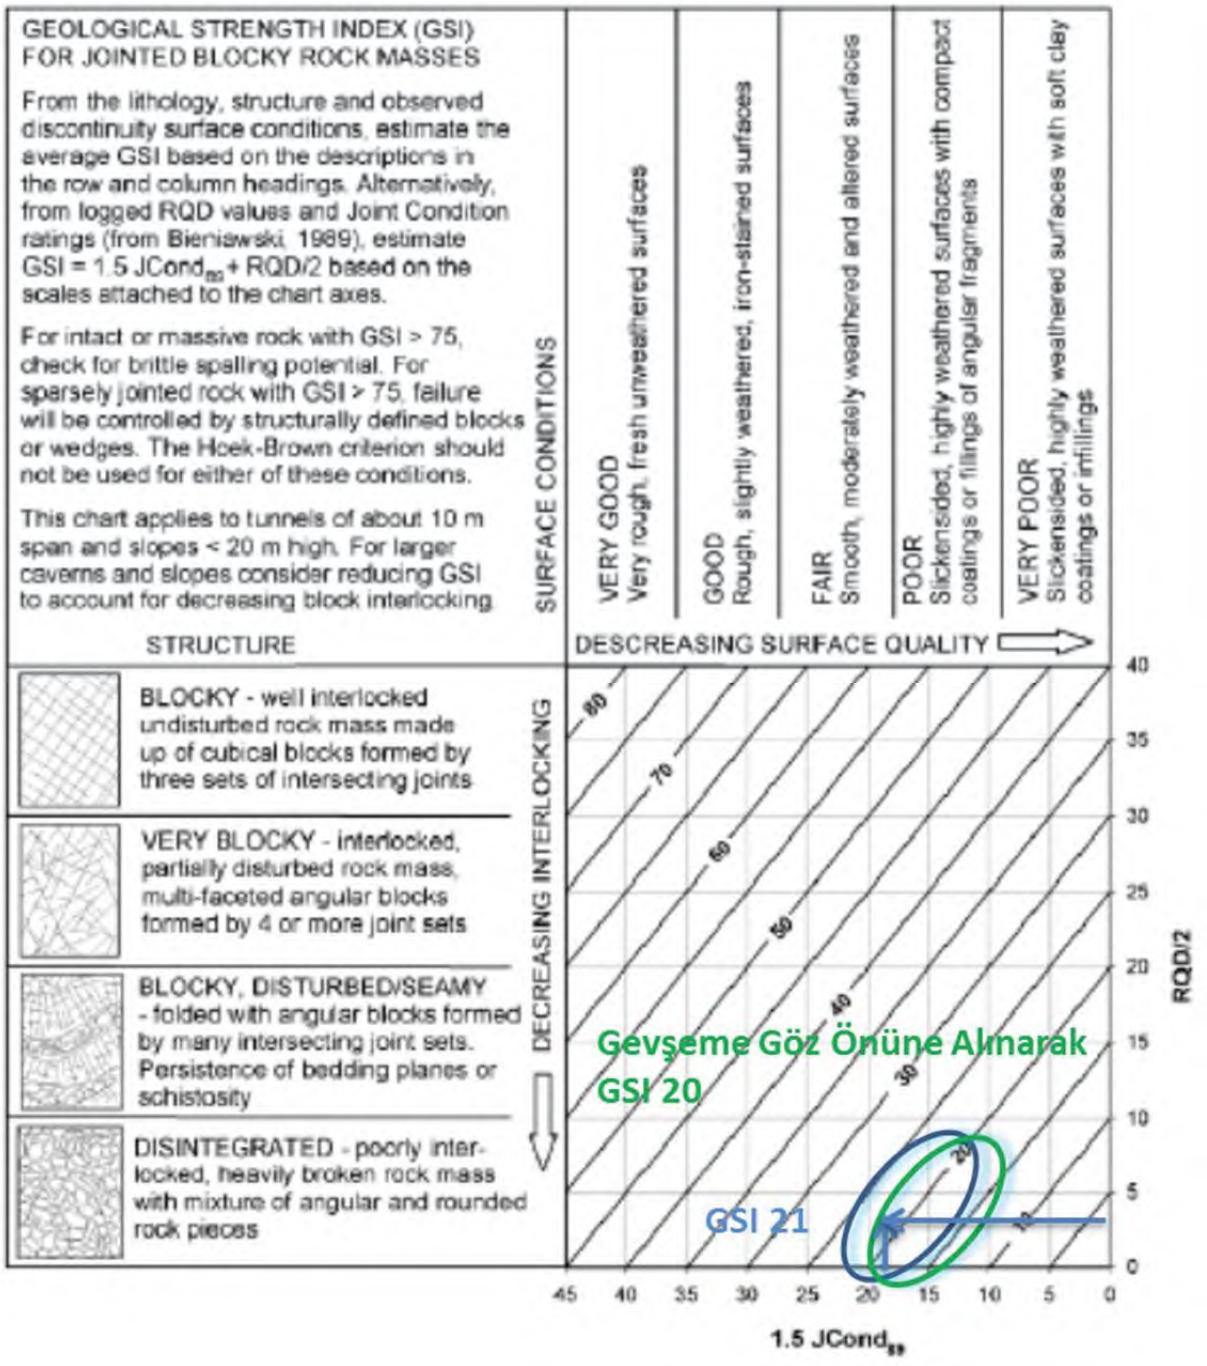
hesaplanmış olup Tablo 34'de verilmiştir.

Tablo 34. Üniteler İçin GSI Değerleri

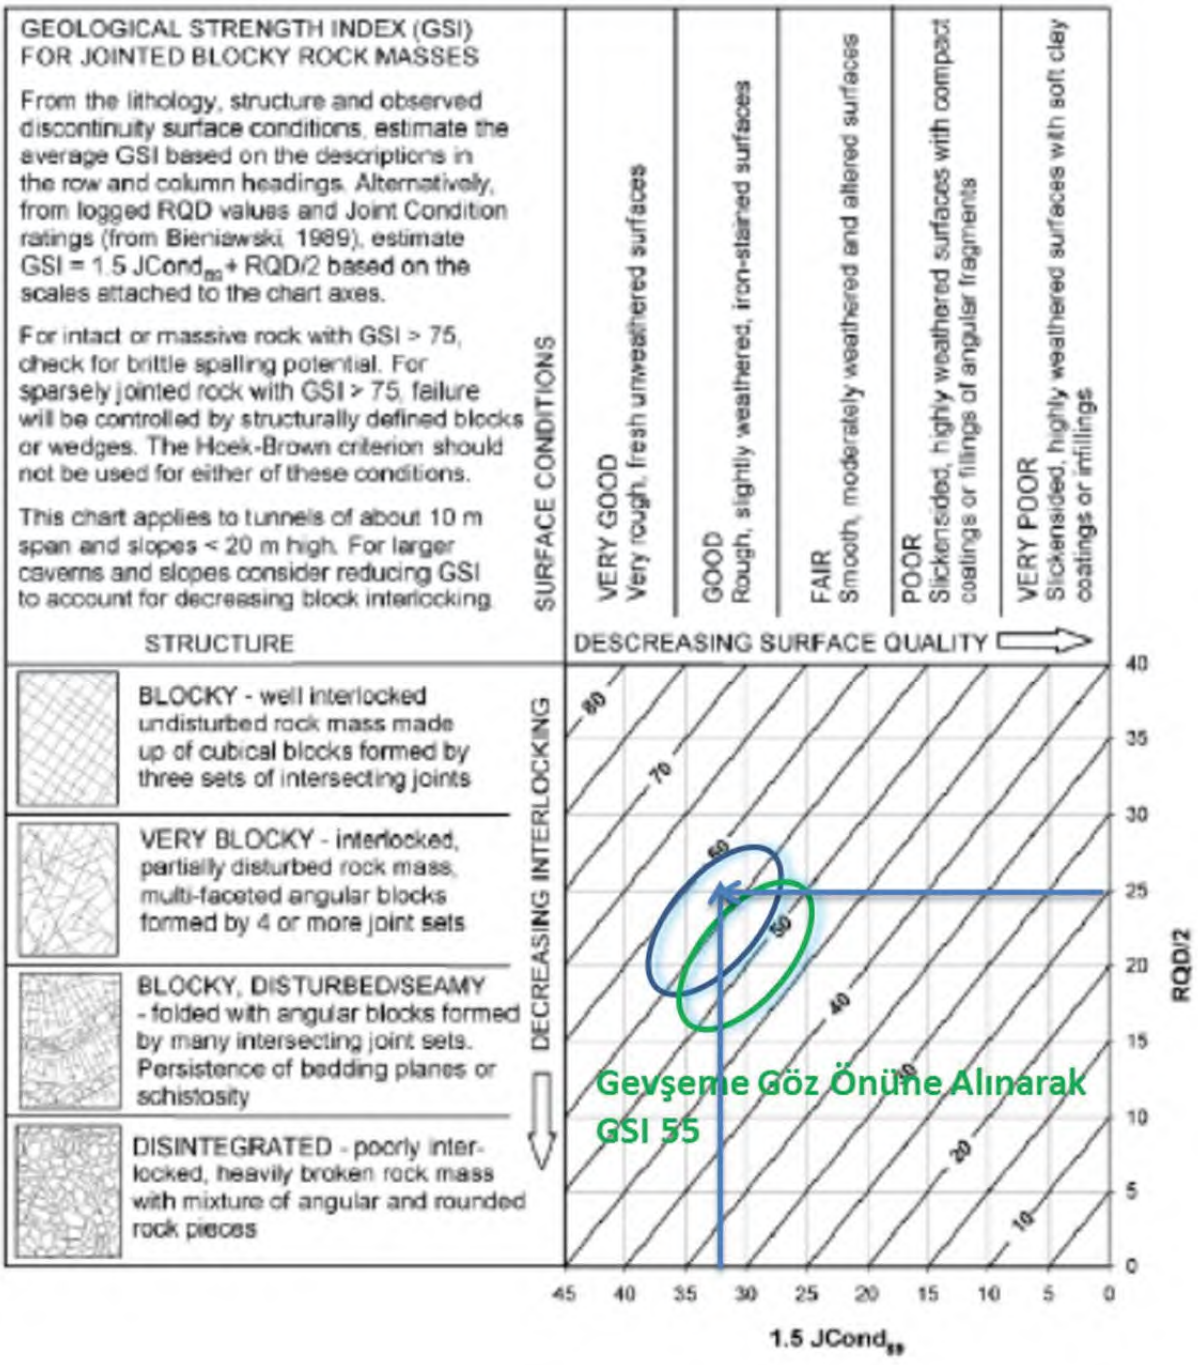
Ünite	Süreksizlik Durumu ($JCond_{89}$)	Kaya Kalite Tanımı [RQD (%)]	Jeolojik Dayanım İndeksi [GSI = 1,5JCond89 + RQD/2]	* Jeolojik Dayanım İndeksi (GSI)
Atık Depolama Tesisi	20	25	43	40
Temiz Su Havuzu	20	25	43	40
Proses Tesis Alanı	12	5	21	20
Pasa Depolama Sahası	22	50	58	55
Sızıntı Havuzu	23	65	67	60
Servis Alanı	20	20	40	35
** Kaya kütlesindeki gevşemeler göz önüne alınarak sınıflama yapılmıştır (Şekil 55, 56, 57, 58, 59)*				



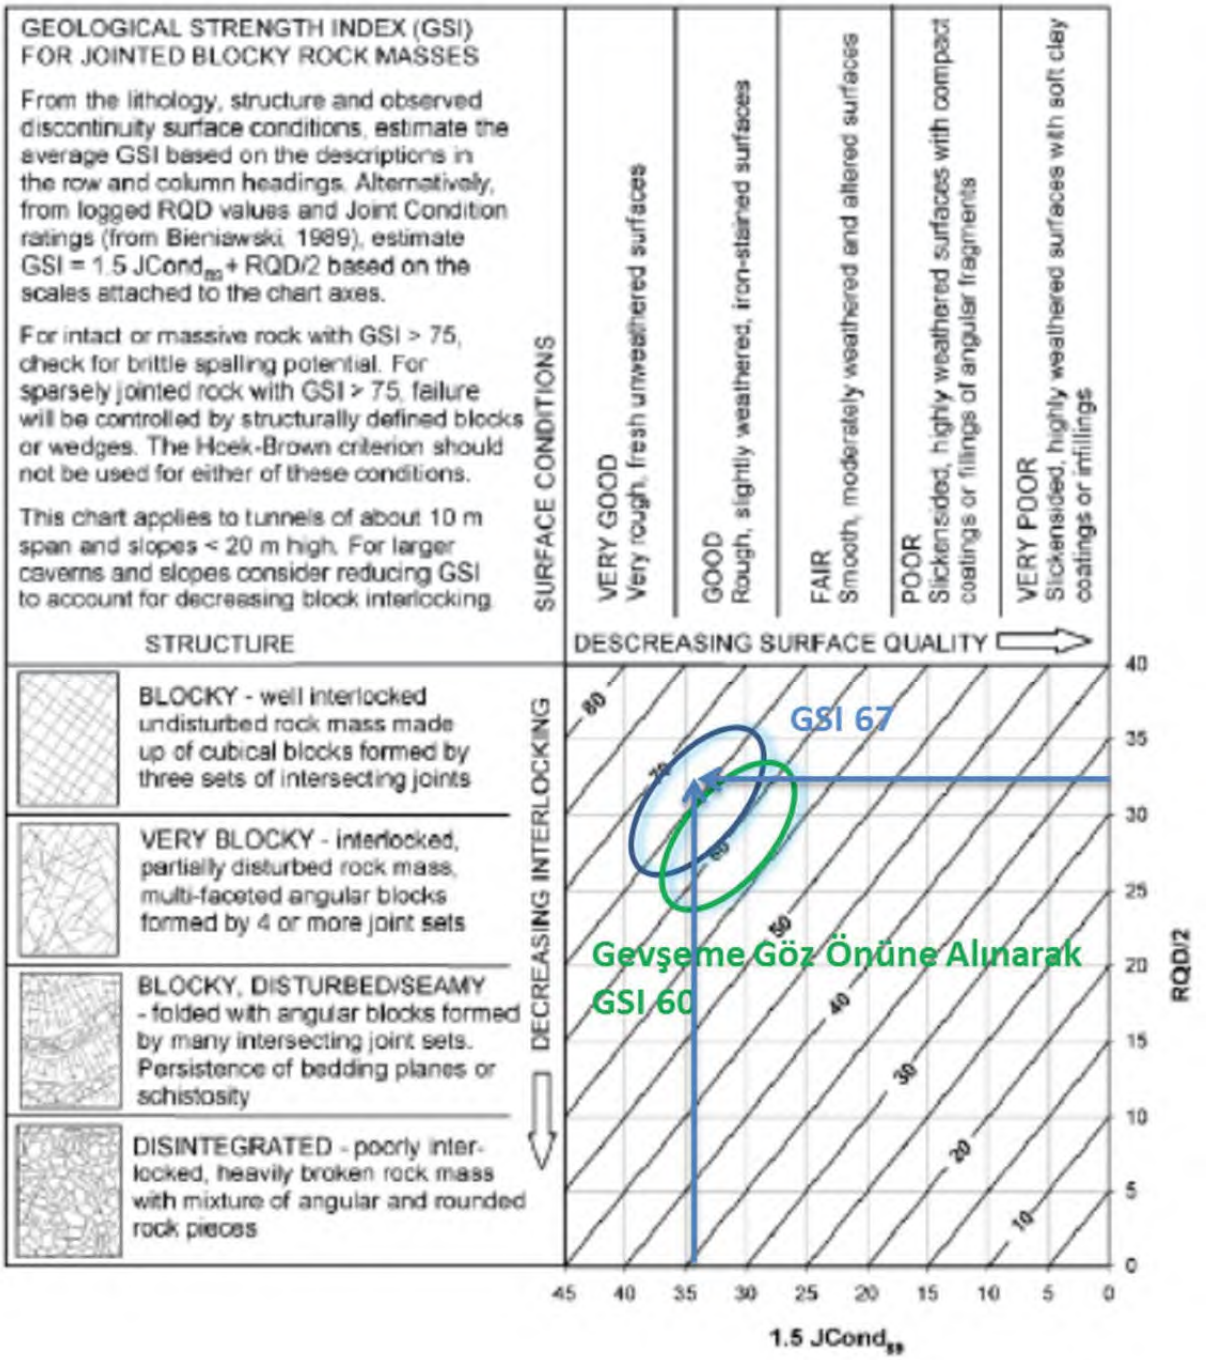
Şekil 57 Atık Depolama Tesisi ve Temiz Su Havuzu Eklem Koşullarına ve RQD'ye Göre Sayısallaştırılmış GSI



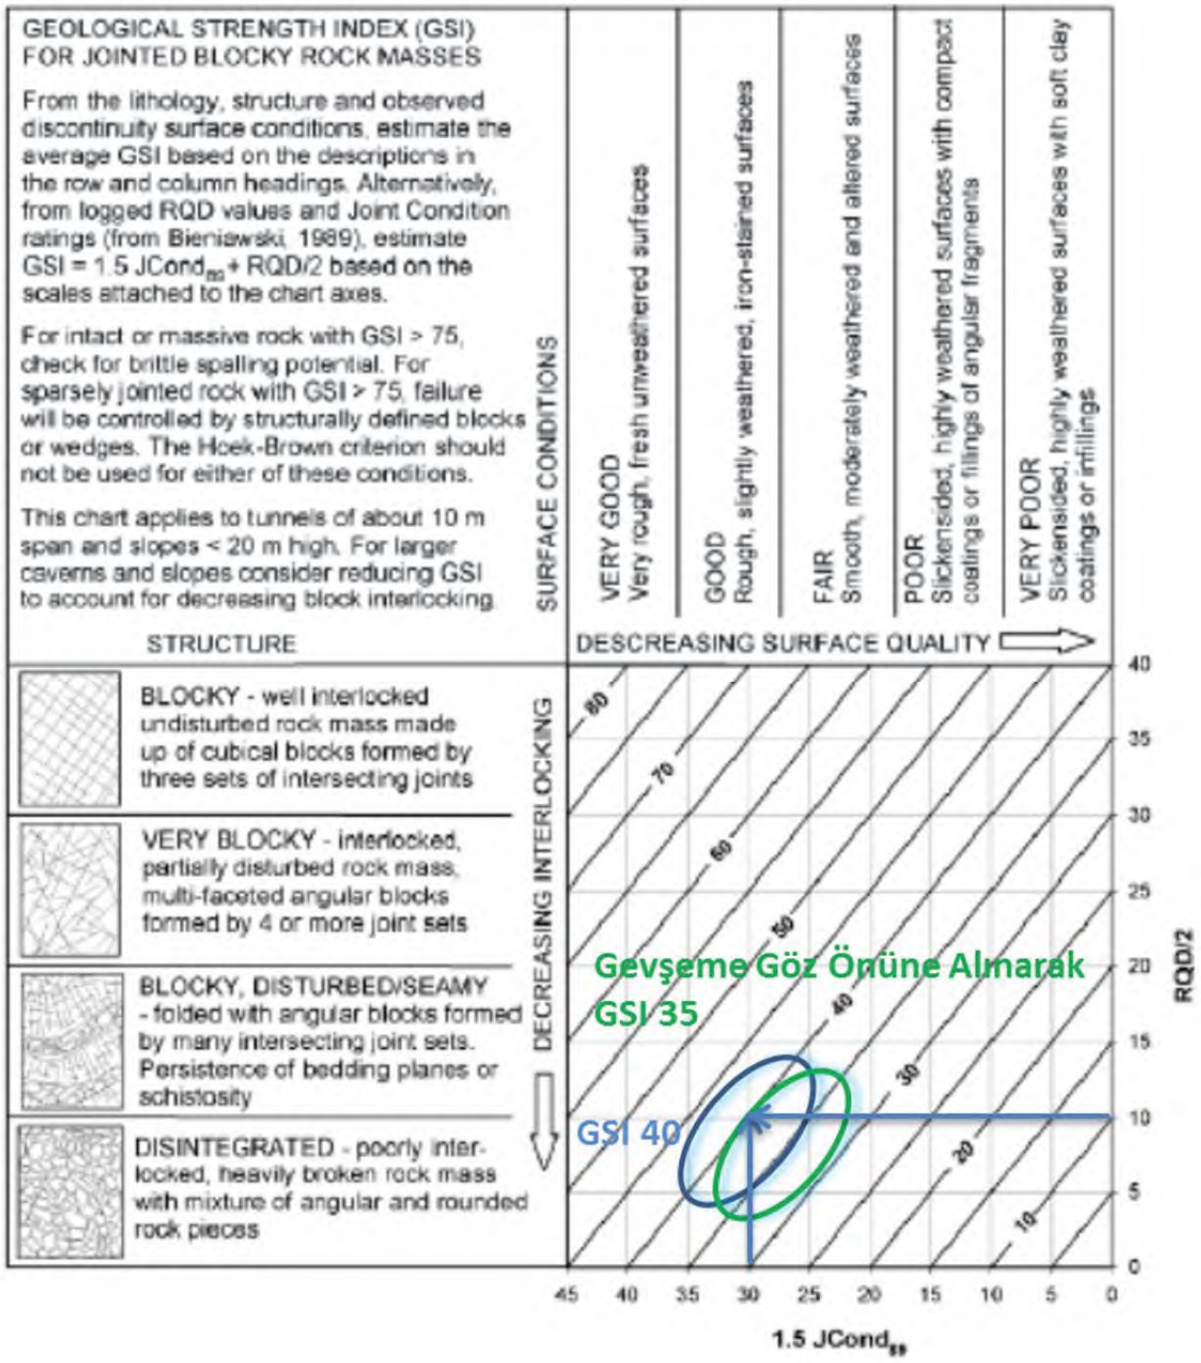
Şekil 58 Proses Tesis Alanı Eklem Koşullarına ve RQD'ye Göre Sayısallaştırılmış GSI



Şekil 59 Pasa Depolama Sahası Eklem Koşullarına ve RQD'ye Göre Sayısallaştırılmış GSI



Şekil 60 Sızıntı Havuzu Eklem Koşullarına ve RQD'ye Göre Sayısallaştırılmış GSI

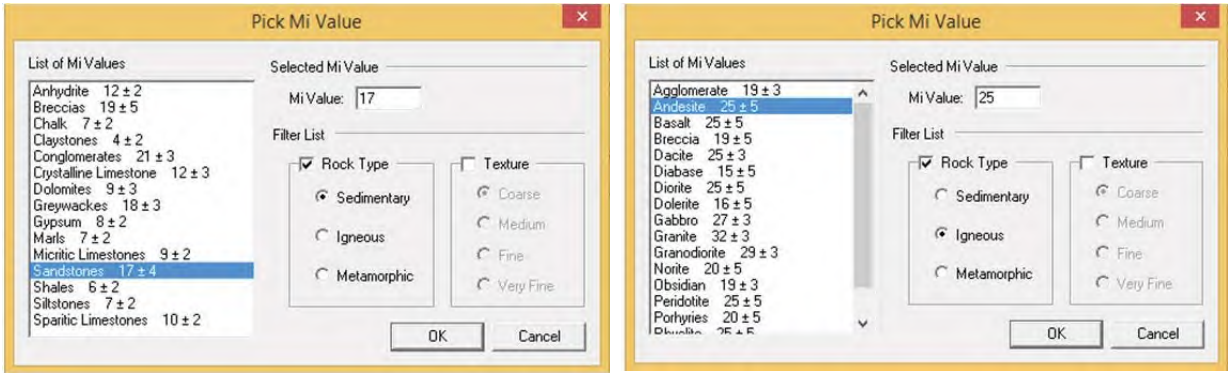


Şekil 61 Servis Alanı Eklem Koşullarına ve RQD'ye Göre Sayısallaştırılmış GSI

- ***Hoek & Brown Sabiti (m_i)***

Hoek ve Brown'un (1980a) önermiş olduğu ve temel olarak üç eksenli deney sonuçlarına dayanan bu azaltma sabiti için RocData bilgisayar yazılımında bulunan ve yazarlar tarafından önerilen değerler üç eksenli sıkışma dayanımı deneylerinin olmadığı litolojilerde kullanılmıştır.

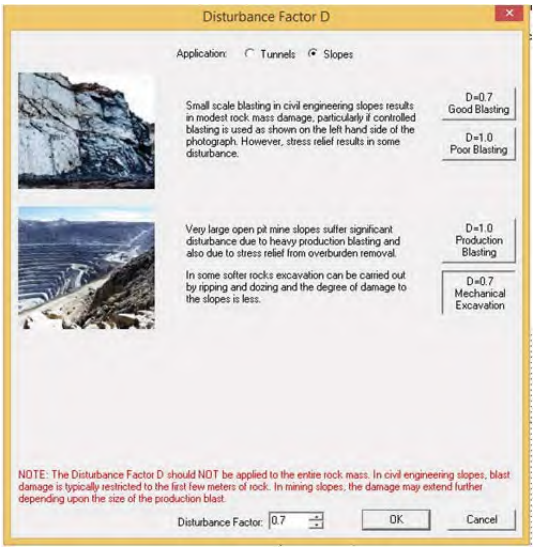
Şekil 62'ye göre Çamurtaşı-Kumtaşı ve Andezit birimlerinden oluşan Karakaya formasyonu (TRkk) tabakası için mi ~ 20 olarak alınmıştır.



Şekil 62 Farklı Litolojiler İçin Önerilen m_i Sabitleri

Örselenme Faktörü (D)

Proje güzergahında yeralan temellerin patlatma ve/veya mekanik kazı ile açılması halinde tünel cidarında patlatmadan ve/veya mekanik kazıdan dolayı bir örselenme zonu oluşacaktır. Şekil 63'de RocData v5.006 bilgisayar yazılımında verilen ve son olarak Hoek (2012)'de ayrıntılı şekilde anlatılan örselenme faktörü gösterilmiştir.



Şekil 63 Örselenme Faktörü Tahmini

7.2.JEOTEKNİK ÖZELLİKLER

Tespit edilen birimlerin mekanik özellikleri bu bölümde aydınlatılacaktır. Zemin ve yamaç molozu birimlerde laboratuvar ve saha verileri ışığında Mohr-Coloumb teorisine göre mukavemet parametreleri ve kaya birimlerde ise farklı deformasyon durumlarında Mohr-Coloumb teorisine göre mukavemet parametreleri ile beraber, Hoek-Brown yenilme kriterine göre sağlam kaya ve kaya kütlesi için tasarım parametreleri verilecektir. Bu hesaplar için laboratuvar, saha gözlemi, sondajlar vs. bütün veriler kullanılacak ve doğal durum sayısallaştırılacaktır.

7.2.1. Atık Depolama Tesisi Jeoteknik Parametreleri

Mohr-Coloumb parametreleri temel altı ve şevler için ayrıca belirlenmiş olup Şev yüksekliği 50,0 m olarak hesaba katılmıştır.

Temel altı; Karakaya formasyonu (TRkk) için Tablo 20, Şekil 29, 30 ve Şekil 31'e göre kaya kütle girdi parametreleri Tablo 35'de sunulmuştur.

Tablo 35 Atık Depolama Tesisi için sağlam kaya parametreleri

Birim Ağırlık (γ_n) (kN/m^3)	Tek Eksenli Dayanım (UCS) (MPa)	Elastisite Modülü (Ei) (GPa)	Poisson Oranı (μ)
25,00	45,00	18	0,27

Örseleme faktörü D=0 Atık Depolama Tesisi Temel altı için hesaplanan kaya kütle parametreleri Tablo 36'da verilmiştir.

Tablo 36 Atık Depolama Tesisi için kaya kütle parametreleri (D=0)

Kaya Kütlesi Tek Eksenli Basınç Dayanımı	Kaya Malzemesi Tek Eksenli Basınç	Jeolojik Dayanım	Hoek&Brown Sabiti	Elastisite Modülü	Kohezyon	İçsel sürtünme açısı	Deformasyon Modülü

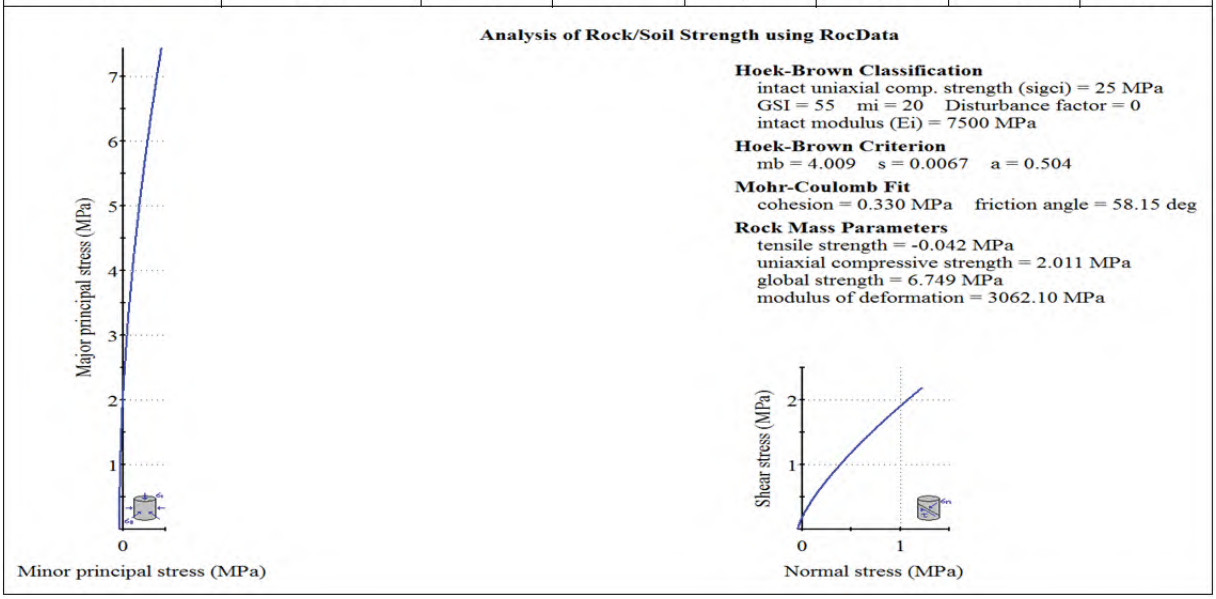
Tablo 49 Pasa Depolama Sahası Tesisi için kaya kütle parametreleri (D=0 ve H=20,0 m)

Kaya Kütlesi Tek Eksenli Basınç Dayanımı	Kaya Malzemesi Tek Eksenli Basınç	Jeolojik Dayanım	Hoek&Brown Sabiti	Elastisite Modülü	Kohezyon	İçsel sürtünme açısı	Deformasyon Modülü
UCS (MPa)	UCS (MPa)	GSI	m_i	Ei (Gpa)	c (MPa)	Ø (^{o})	E_m (MPa)
2,01	25,00	55	20	7,50	0,33	58	3.062



7.2.4. Proses Tesis Alanı Jeoteknik Parametreleri

Mohr-Coloumb parametreleri temel altı için ayrıca belirlenmiştir.

Temel altı; Karakaya formasyonu (TRkk) için Tablo 24, Şekil 38, 39 ve Şekil 40'a göre kaya kütle girdi parametreleri Tablo 50'de sunulmuştur.

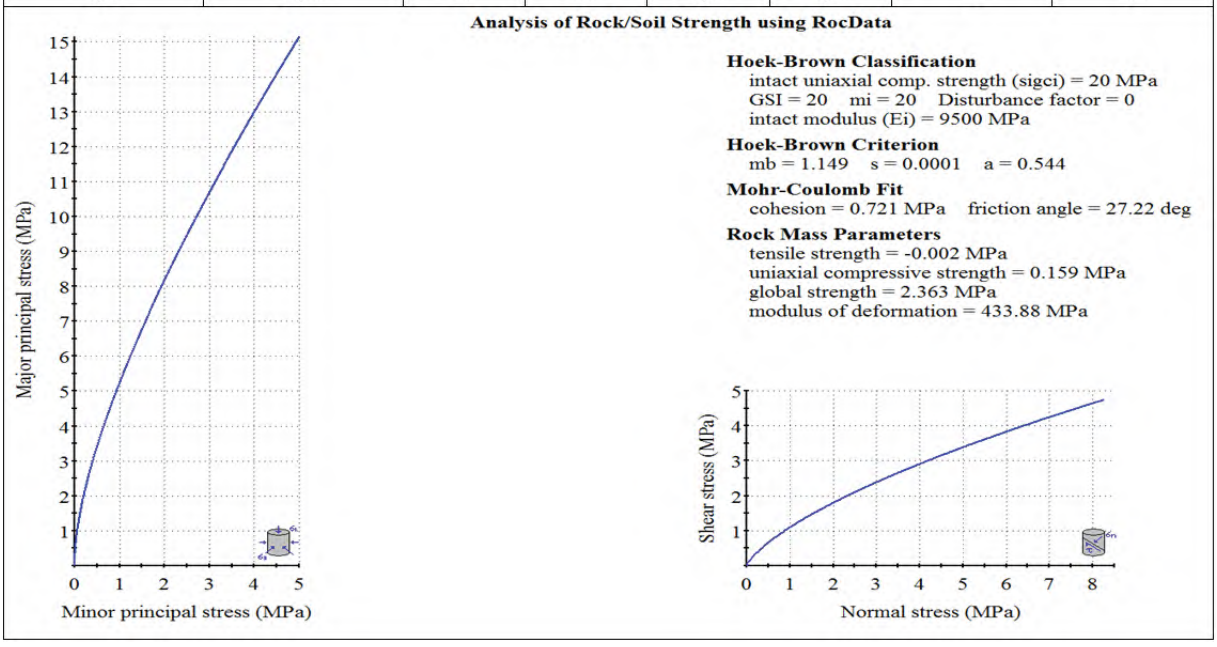
Tablo 50 Proses Tesis Alanı için sağlam kaya parametreleri

Birim Ağırlık (γ_n) (kN/m^3)	Tek Eksenli Dayanım (UCS) (MPa)	Elastisite Modülü (Ei) (GPa)	Poisson Oranı (μ)
24,00	20,00	9,50	0,28

Örseleme faktörü D=0 Proses tesis alanı temel altı için hesaplanan kaya kütle parametreleri Tablo51'de verilmiştir.

Tablo 51 Proses Tesis Alanı için kaya kütle parametreleri (D=0)

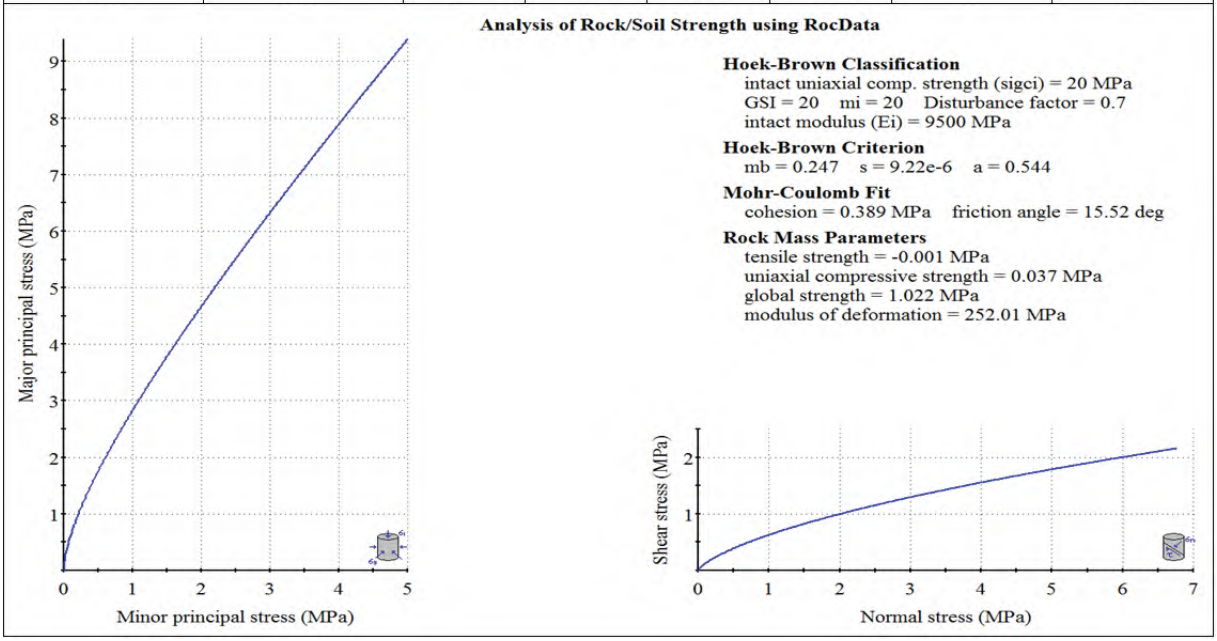
Kaya Kütlesi Tek Eksenli Basınç Dayanımı	Kaya Malzemesi Tek Eksenli Basınç Dayanımı	Jeolojik Dayanım İndeksi	Hoek&Brown Sabiti	Elastisite Modülü	Kohezyon	İçsel Sürtünme Açısı	Deformasyon Modülü
UCS (MPa)	UCS (MPa)	GSI	m_i	Ei (Gpa)	c (MPa)	ø (°)	E_m (MPa)
0,16	20,00	20	20	9,50	0,72	27	434



Örseleme faktörü D=0,7 Proses Tesis Alanı Temel altı için hesaplanan kaya kütle parametreleri Tablo52'de verilmiştir.

Tablo 52 Proses Tesis Alanı için kaya kütle parametreleri (D=0,7)

Kaya Kütlesi Tek Eksenli Basınç Dayanımı	Kaya Malzemesi Tek Eksenli Basınç Dayanımı	Jeolojik Dayanım İndeksi	Hoek&Brown Sabiti	Elastisite Modülü	Kohezyon	İçsel Sürtünme Açısı	Deformasyon Modülü
UCS (MPa)	UCS (MPa)	GSI	m_i	Ei (Gpa)	c (MPa)	Ø (°)	E_m (MPa)
0,037	20,00	20	20	9,50	0,389	16	252



Hesaplanan kaya kütle parametreleri yapı temeli içindir. Tüneller ve/veya yamaçlar için gerekmesi halinde, kaya kütle parametreleri, şev yüksekliği ve tüneller için örtü yükü kalınlığı dikkate alınarak ayrı olarak hesaplanmalıdır.

7.2.5. Sızıntı Havuzu Jeoteknik Parametreleri

Mohr-Coloumb parametreleri temel altı için ayrıca belirlenmiştir.

Temel altı; Karakaya formasyonu (TRkk) için Tablo 20, Şekil 41 ve Şekil 42'ye göre kaya kütle girdi parametreleri Tablo 53'de sunulmuştur.

Hesaplanan kaya kütle parametreleri yapı temeli içindir. Tüneller ve/veya yamaçlar için gerekmesi halinde, kaya kütle parametreleri, şev yüksekliği ve tüneller için örtü yükü kalınlığı dikkate alınarak ayrı olarak hesaplanmalıdır.

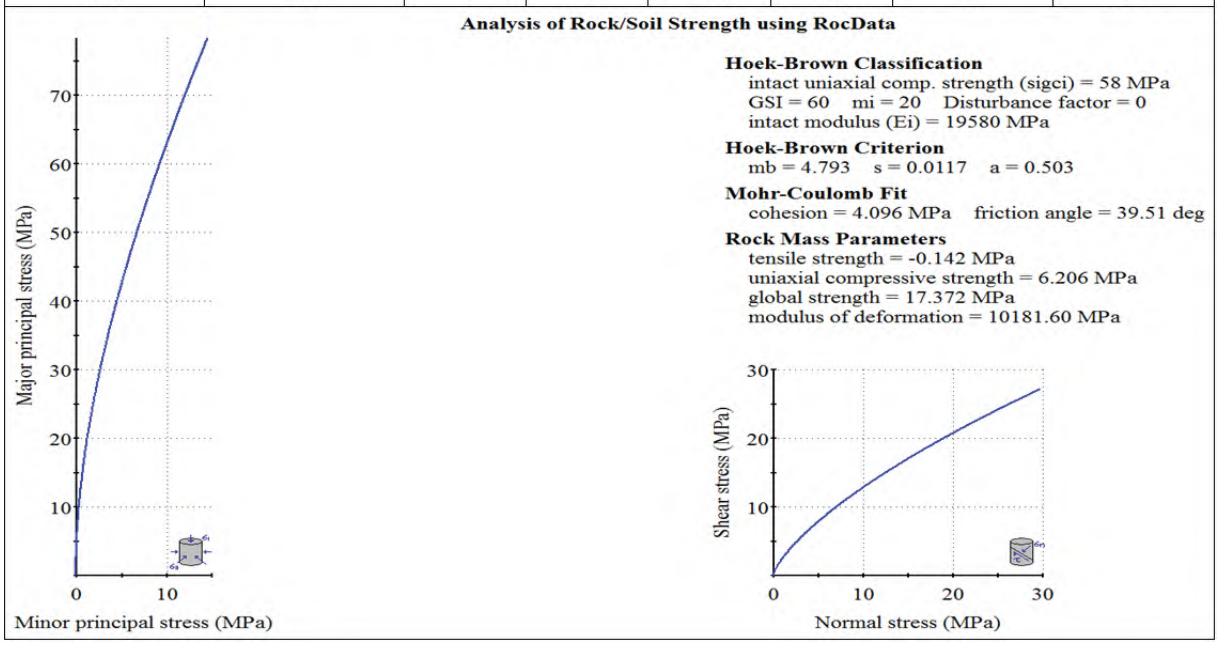
Tablo 53 Sızıntı Havuzu için sağlam kaya parametreleri

Birim Ağırlık (γ_n) (kN/m^3)	Tek Eksenli Dayanım (UCS) (MPa)	Elastisite Modülü (Ei) (GPa)	Poisson Oranı (μ)
25,50	58,00	19,58	0,19

Örseleme faktörü D=0 sızıntı havuzu temel altı için hesaplanan kaya kütle parametreleri Tablo54'de verilmiştir.

Tablo 54 Sızıntı Havuzu için kaya kütle parametreleri (D=0)

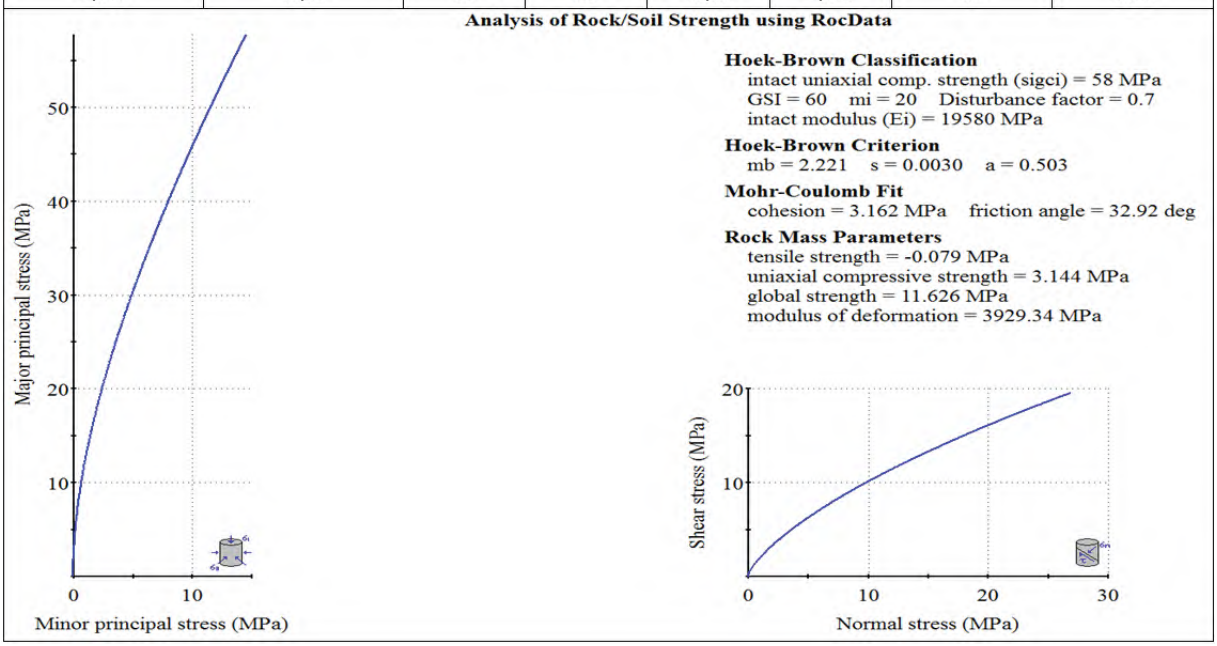
Kaya Kütlesi Tek Eksenli Basınç Dayanımı	Kaya Malzemesi Tek Eksenli Basınç Dayanımı	Jeolojik Dayanım İndeksi	Hoek&Brown Sabiti	Elastisite Modülü	Kohezyon	İçsel Sürtünme Açısı	Deformasyon Modülü
UCS (MPa)	UCS (MPa)	GSI	m_i	Ei (Gpa)	c (MPa)	Ø (°)	E_m (MPa)
6,206	58,00	60	20	19,58	4,096	40	10.182



Örseleme faktörü D=0,7 Sızıntı Havuzu Temel altı için hesaplanan kaya kütle parametreleri Tablo55'de verilmiştir.

Tablo 55 Sızıntı Havuzu için kaya kütle parametreleri (D=0,7)

Kaya Kütlesi Tek Eksenli Basınç Dayanımı	Kaya Malzemesi Tek Eksenli Basınç Dayanımı	Jeolojik Dayanım İndeksi	Hoek&Brown Sabiti	Elastisite Modülü	Kohezyon	İçsel Sürtünme Açısı	Deformasyon Modülü
UCS (MPa)	UCS (MPa)	GSI	m_i	Ei (Gpa)	c (MPa)	Ø (°)	E_m (MPa)
3,144	58,00	60	20	19,58	3,162	33	3.929



7.2.6. Servis Alanı Jeoteknik Parametreleri

Mohr-Coloumb parametreleri temel altı için ayrıca belirlenmiştir.

Temel altı; Karakaya formasyonu (TRkk) için Tablo 22, Şekil 43, 44 ve Şekil 45'e göre kaya kütle girdi parametreleri Tablo 56'da sunulmuştur.

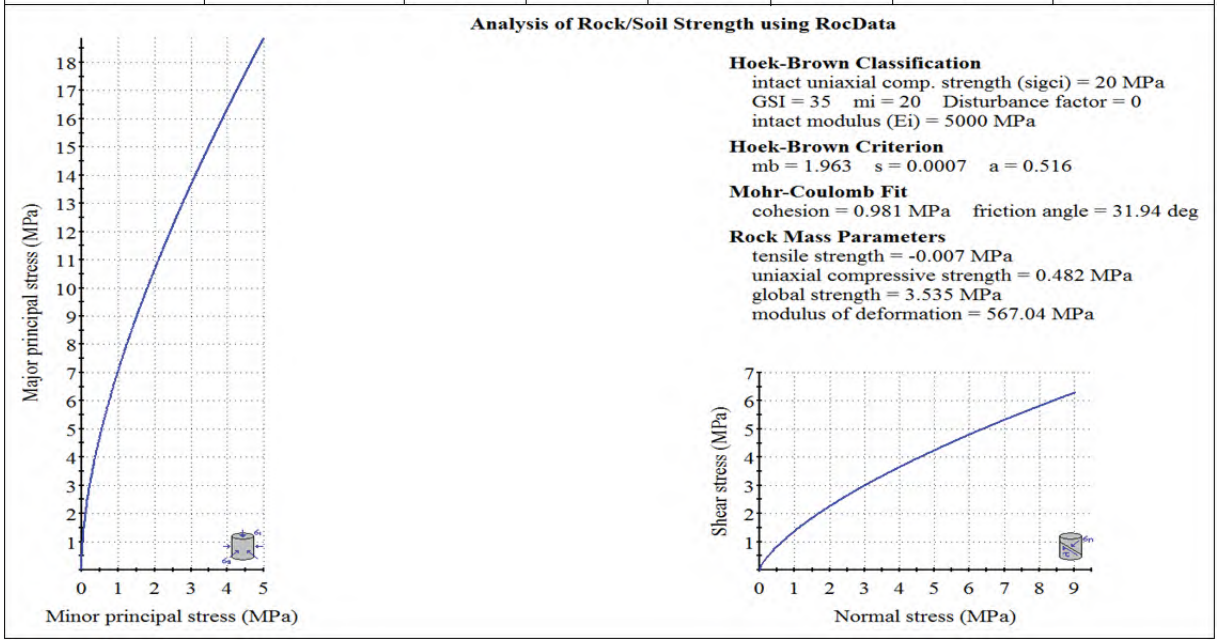
Tablo 56 Servis Alanı için sağlam kaya parametreleri

Birim Ağırlık (γ_n) (kN/m^3)	Tek Eksenli Dayanım (UCS) (MPa)	Elastisite Modülü (Ei) (GPa)	Poisson Oranı (μ)
22,50	20,00	5,00	0,35

Örseleme faktörü D=0 Servis Alanı Temel altı için hesaplanan kaya kütle parametreleri Tablo57'de verilmiştir.

Tablo 57 Servis Alanı için kaya kütle parametreleri (D=0)

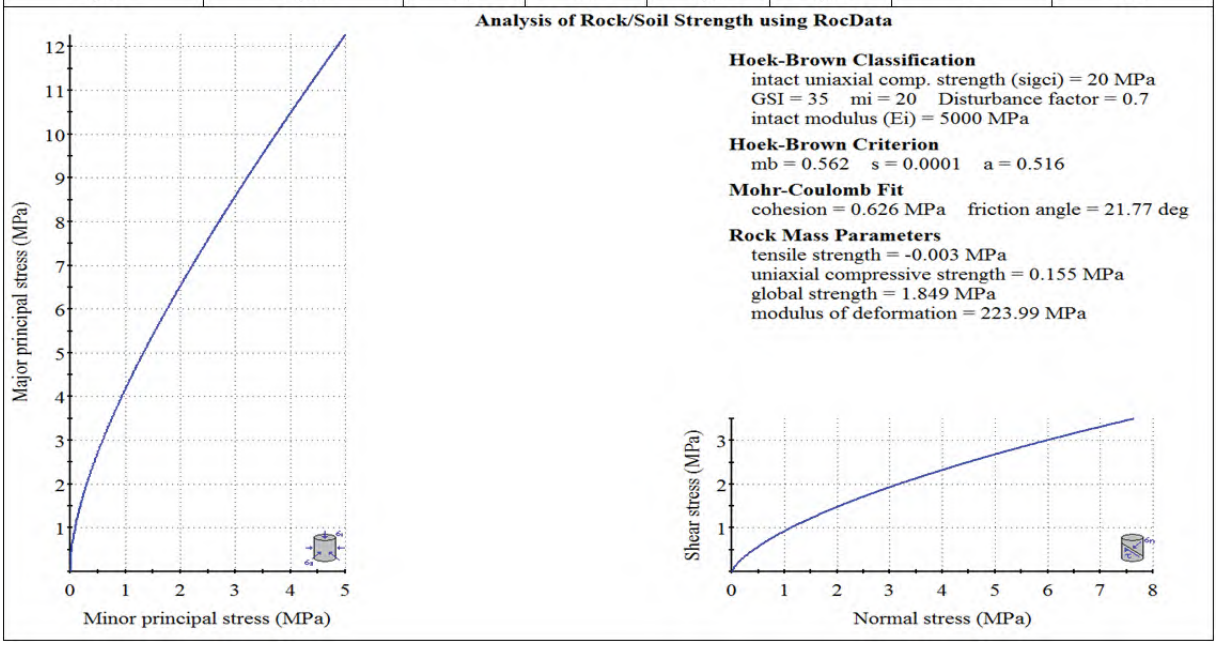
Kaya Kütlesi Tek Eksenli Basınç Dayanımı	Kaya Malzemesi Tek Eksenli Basınç Dayanımı	Jeolojik Dayanım İndeksi	Hoek&Brown Sabiti	Elastisite Modülü	Kohezyon	İçsel Sürtünme Açısı	Deformasyon Modülü
UCS (MPa)	UCS (MPa)	GSI	m_i	Ei (Gpa)	c (MPa)	Ø (°)	E_m (MPa)
0,482	20,00	35	20	5,00	0,981	32	567



Örseleme faktörü D=0,7 Servis Alanı Temel altı için hesaplanan kaya kütle parametreleri Tablo58'de verilmiştir.

Tablo 58 Servis Alanı için kaya kütle parametreleri (D=0,7)

Kaya Kütlesi Tek Eksenli Basınç Dayanımı	Kaya Malzemesi Tek Eksenli Basınç Dayanımı	Jeolojik Dayanım İndeksi	Hoek&Brown Sabiti	Elastisite Modülü	Kohezyon	İçsel Sürtünme Açısı	Deformasyon Modülü
UCS (MPa)	UCS (MPa)	GSI	m_i	Ei (Gpa)	c (MPa)	Ø (°)	E_m (MPa)
0,155	20,00	35	20	5,00	0,626	22	224



Hesaplanan kaya kütle parametreleri yapı temeli içindir. Tüneller ve/veya yamaçlar için gerekmesi halinde, kaya kütle parametreleri, şev yüksekliği ve tüneller için örtü yükü kalınlığı dikkate alınarak ayrı olarak hesaplanmalıdır.

8. YAPI ZEMİN ETKİLEŞİMİ

8.1.Atık Depolama Tesisi Oturma

Atık depolama tesisi kapsamında 45m yüksekliğe kadar ulaşan gövde bulunmaktadır.

Maksimum yük = h* γ_n

Burada;

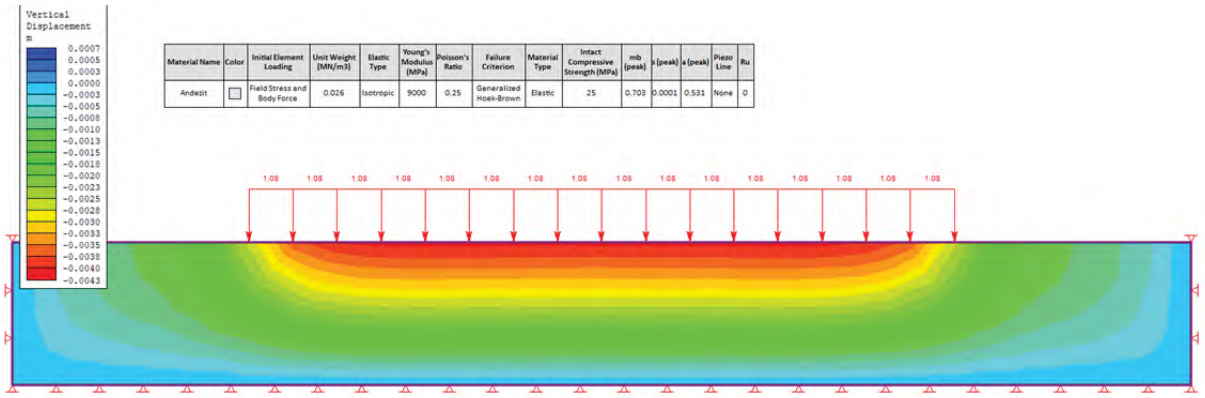
H= eksenin maksimum yüksekliği (45,0 m)

γ_n= Kaya dolgunun birim hacim ağırlığı (24,0 kN/m^3)

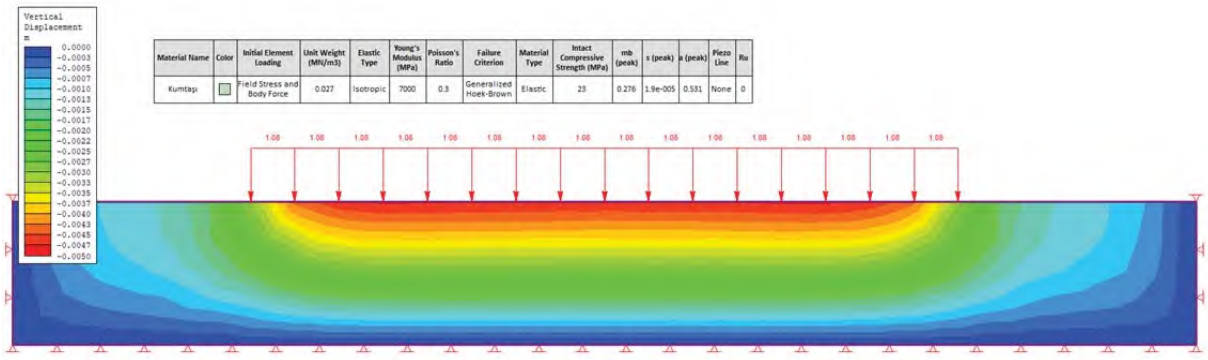
Buna göre;

Maksimum yük = 45* 24 =1.080 kPa

olarak hesaplanmıştır. Yapılan analiz sonucunda Andezit ve Kumtaşı birimde yapılacak olan dolguda 5mm mertebesinde maksimum oturma beklenmektedir (Şekil 64 ve Şekil 65)



Şekil 64 ADT Andezit birim oturmaları



Şekil 65 ADT Kumtaşı birim oturmaları

Dolgu yükü kN/m^2 cinsindendir. Orta noktada maksimum 1.080 kN/m^2 olup kenarlara doğru sönümlenmektedir.

8.2. Taşıma Gücü

Karakaya formasyonu (TRkk) birimlerine oturacak yapıların temelleri için taşıma gücü; kayacın ayrışma derecesi, eklem sistemi, süreksizlikler arası dolgu malzemesi ve dayanımı dikkate alınarak Kanada şartnamesi ve Peck et al. tarafından önerilen ampirik yaklaşımlarla ve laboratuvar deneylerinden elde edilen verilerden yararlanılarak hesaplanmış ve aşağıdaki paragraflarda verilmiştir. Taşıma gücü hesaplarında güvenli tarafta kalmak amacı ile kayacın fiziksel özelliğinin en olumsuz durumu, mukavemet parametrelerinin ise en düşüğü alınmıştır.

- **Atık Depolama Tesisi Taşıma Gücü**

Atık depolama tesisi sahasının ana kayası olan Karakaya formasyonu (TRkk) için taşıma gücü içini aşağıda iki farklı yöntemle hesaplamalar yapılmıştır.

Kanada Şartnamesi (Canadian Foundation Engineering Manual, 2006)

$$q_a \sim Ksp * UCS\ (MPa)$$

q_a : İzin verilen taşıma gücü değerleri

UCS : Kayacın ortalama tek eksenli basınç dayanımı ~45 (Tablo 35)

Ksp : 0,10 ila 0,40 arasında değişen ampirik katsayı (Tablo59)

Tablo 59. Ksp Katsayısının Süreksizlik Aralığına Bağlı Değişimi

Süreksizlik Aralığı		Ksp
Tanım	Aralık (m)	
Orta Derece Açık	0,30-1,00	0,10
Geniş	1,00-3,00	0,25
Çok Geniş	>3,00	0,40

Buna göre;

$q_a \sim 0{,}10 * 45 \sim 4{,}50$ MPa

olarak hesaplanmıştır.

Peck et.al.

Peck ve diğerleri, Şekil 66'da gösterildiği gibi, bir kaya kütlesinin taşıma kapasitesi üzerinde önemli bir etkiye sahip olan, izin verilen taşıma kapasitesi gerilimi ile RQD arasında ampirik bir korelasyon önermiştir. Korelasyon, "bir inçin (25 mm) kesirinden daha geniş" olan "sıkı veya açık olmayan" süreksizlikleri olan bir kaya kütlesi için tasarlanmıştır. İzin verilen taşıma kapasitesi ile RQD arasındaki ilişki, aşağıdaki formülasyon kullanılarak yaklaşık olarak hesaplanabilir:

$$q_a \sim 11{,}74 \times e^{0{,}032x(RQD)}\ (Tsf)$$

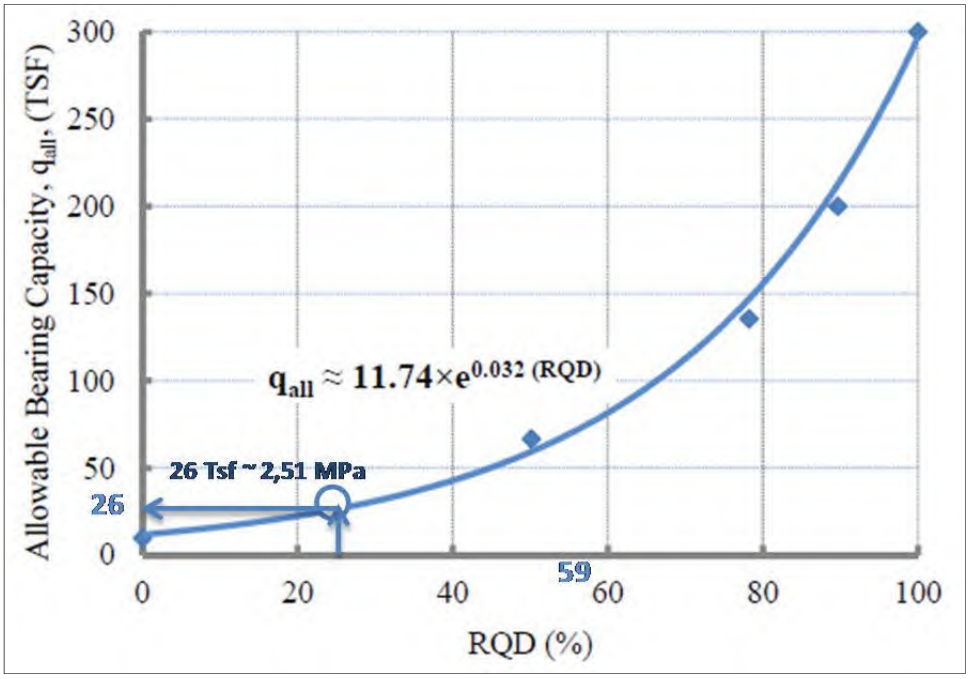
1 Tsf : 0,096MPa

RQD : %25 (Tablo 27)

Şekil 66'ya göre;

q_a ~ 2,51 MPa

olarak hesaplanmıştır.



Şekil 66 ADT İzin Verilen Taşıma Gücü (Peck vd)

Yukarıda verilen iki farklı ampirik yaklaşımla izin verilebilir taşıma gücü değerleri Tablo 60'da özetlenmiştir.

Tablo 60. Atık Depolama Tesisi İçin İzin Verilebilir Taşıma Gücü Değerleri

Kanada Şartnamesi			Peck vd.			qa/qall (MPa)		
UCS (MPa)	Ksp	qa/qall (MPa)	RQD (%)	qa/qall		Min.	Maks.	Önerilen
				Tsf	(MPa)			
45,00	0,10	4,50	25	26	2,50	2,50	4,50	2,50
Gerilme		1,08			1,08			1,08

Yapının temele aktardığı gerilme ~ 1,08 MPa (G+Q) olup Karakaya formasyonu (TRkk) için izin verilebilir taşıma gücü minumum ~ 2,50 MPa olarak Tablo 60'da hesaplanmış olup dolayısıyla 1,08 MPa < 2,50 MPa (qt < qa) olduğu için taşıma gücü bakımından bir sorun beklenmez.

➢ Temiz Su Havuzu Taşıma Gücü

Temiz su havuzu sahasının ana kayası olan Karakaya formasyonu (TRkk) için taşıma gücü içini aşağıda iki farklı yöntemle hesaplamalar yapılmıştır.

Kanada Şartnamesi (Canadian Foundation Engineering Manual, 2006)

$q_a \sim Ksp * UCS\ (MPa)$

q_a : İzin verilen taşıma gücü değerleri

UCS : Kayacın ortalama tek eksenli basınç dayanımı ~35 MPa (Tablo 40)

Ksp : 0,10 ila 0,40 arasında değişen ampirik katsayı (Tablo 59)

Buna göre;

$q_a \sim 0{,}10 * 35 \sim 3{,}50$ MPa

olarak hesaplanmıştır.

Peck et.al.

Peck ve diğerleri, Şekil 67'de gösterildiği gibi, bir kaya kütlesinin taşıma kapasitesi üzerinde önemli bir etkiye sahip olan, izin verilen taşıma kapasitesi gerilimi ile RQD arasında ampirik bir korelasyon önermiştir. Korelasyon, "bir inçin (25 mm) kesirinden daha geniş" olan "sıkı veya açık olmayan" süreksizlikleri olan bir kaya kütlesi için tasarlanmıştır. İzin verilen taşıma kapasitesi ile RQD arasındaki ilişki, aşağıdaki formülasyon kullanılarak yaklaşık olarak hesaplanabilir:

$q_a \sim 11{,}74 \times e^{0{,}032x(RQD)}\ (Tsf)$

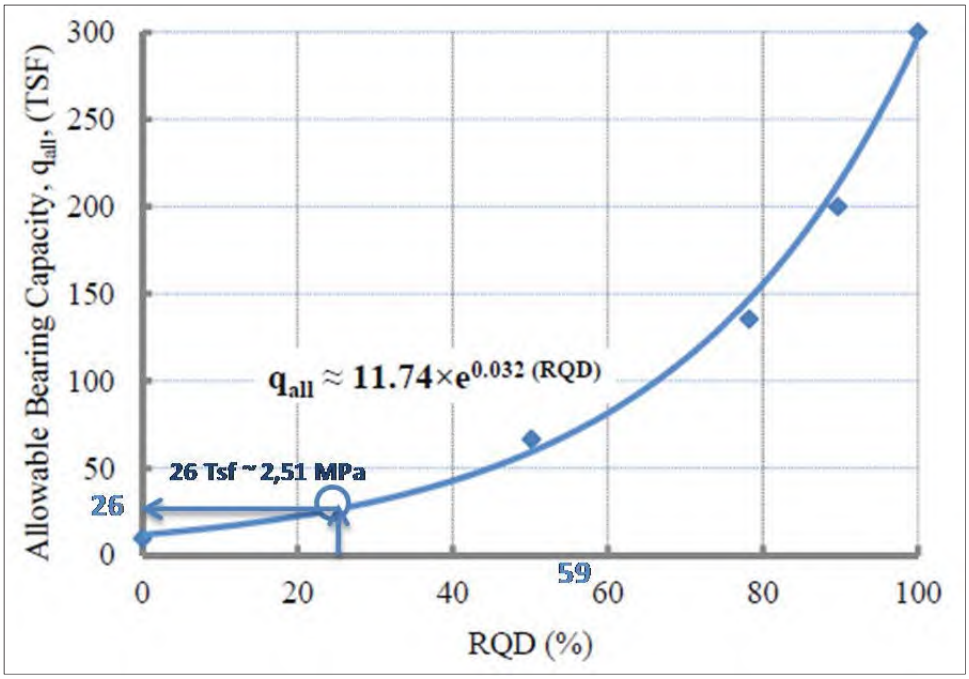
1 Tsf : 0,096MPa

RQD : %25 (Tablo 35)

Şekil 67'ye göre;

$q_a \sim 2{,}51$ MPa

olarak hesaplanmıştır.



Şekil 67 Temiz Su Havuzu İzin Verilen Taşıma Gücü (Peck vd)

Yukarıda verilen iki farklı ampirik yaklaşımla izin verilebilir taşıma gücü değerleri Tablo 61'de özetlenmiştir.

Tablo 61. Temiz Su Havuzu Tesisi İçin İzin Verilebilir Taşıma Gücü Değerleri

Kanada Şartnamesi			Peck vd.			qa/qall (MPa)		
UCS (MPa)	Ksp	qa/qall (MPa)	RQD (%)	qa/qall		Min.	Maks.	Önerilen
				Tsf	(MPa)			
35,00	0,10	3,50	25	26	2,50	2,50	4,50	2,50
Gerilme		0,25			0,25			0,25

Yapının temele aktardığı gerilme ~ 0,25 MPa (G+Q) olup Karakaya formasyonu (TRkk) için izin verilebilir taşıma gücü minumum ~ 2,50 MPa olarak Tablo 61'de hesaplanmış olup dolayısıyla 0,25 MPa < 2,50 MPa (qt < qa) olduğu için taşıma gücü bakımından bir sorun beklenmez.

➢ Proses Tesis Alanı Taşıma Gücü

Proses Tesis Alanı sahasının ana kayası olan Karakaya formasyonu (TRkk) için taşıma gücü içini aşağıda iki farklı yöntemle hesaplamalar yapılmıştır.

Kanada Şartnamesi (Canadian Foundation Engineering Manual, 2006)

$q_a \sim Ksp * UCS\ (MPa)$

q_a : İzin verilen taşıma gücü değerleri

UCS : Kayacın ortalama tek eksenli basınç dayanımı ~20 MPa (Tablo 40)

Ksp : 0,10 ila 0,40 arasında değişen ampirik katsayı (Tablo 59)

Buna göre;

$q_a \sim$ 0,10 * 20 ~2,00 MPa

olarak hesaplanmıştır.

Peck et.al.

Peck ve diğerleri, Şekil 68'de gösterildiği gibi, bir kaya kütlesinin taşıma kapasitesi üzerinde önemli bir etkiye sahip olan, izin verilen taşıma kapasitesi gerilimi ile RQD arasında ampirik bir korelasyon önermiştir. Korelasyon, "bir inçin (25 mm) kesirinden daha geniş" olan "sıkı veya açık olmayan" süreksizlikleri olan bir kaya kütlesi için tasarlanmıştır. İzin verilen taşıma kapasitesi ile RQD arasındaki ilişki, aşağıdaki formülasyon kullanılarak yaklaşık olarak hesaplanabilir:

$q_a \sim 11,74 \times e^{0,032x(RQD)}(Tsf)$

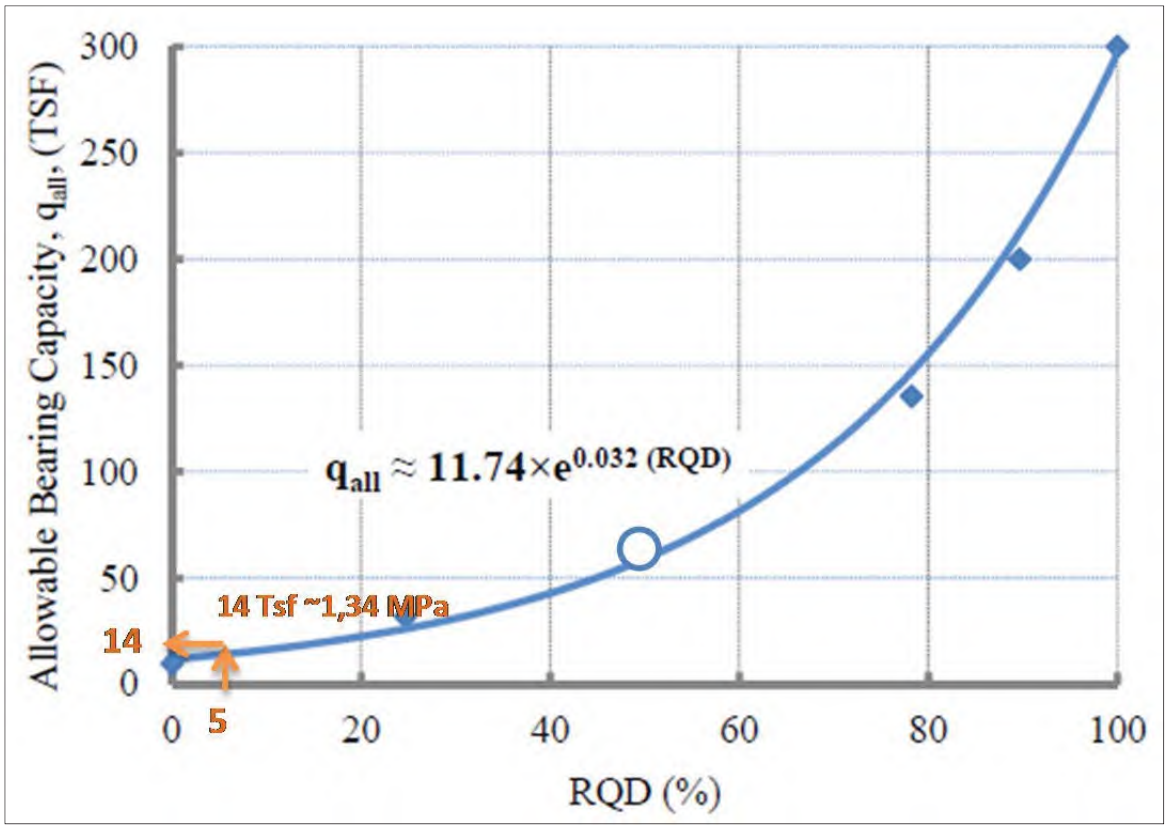
1 Tsf : 0,096MPa

RQD : %5 (Tablo 50)

Şekil 68'e göre;

$q_a \sim$ 5,58 MPa

olarak hesaplanmıştır.



Şekil 68 Pasa Depolama Sahası İzin Verilen Taşıma Gücü (Peck vd)

Yukarıda verilen iki farklı ampirik yaklaşımla izin verilebilir taşıma gücü değerleri Tablo 62'de özetlenmiştir.

Tablo 62. Proses Tesis Alanı Tesisi İçin İzin Verilebilir Taşıma Gücü Değerleri

Kanada Şartnamesi			Peck vd.			qa/qall (MPa)		
UCS (MPa)	Ksp	qa/qall (MPa)	RQD (%)	qa/qall		Min.	Maks.	Önerilen
				Tsf	(MPa)			
20,00	0,10	2,00	5	14	1,34	1,34	2,00	1,34
Gerilme		0,75			0,75			0,75

Yapının temele aktardığı gerilme ~ 0,75 MPa (G+Q) olup Karakaya formasyonu (TRkk) için izin verilebilir taşıma gücü minumum ~ 1,34 MPa olarak Tablo 62'de hesaplanmış olup dolayısıyla 0,75 MPa < 1,34 MPa (qt < qa) olduğu için taşıma gücü bakımından bir sorun beklenmez.

➢ Pasa Depolama Sahası Taşıma Gücü

Pasa depolama sahasının ana kayası olan Karakaya formasyonu (TRkk) için taşıma gücü içını aşağıda iki farklı yöntemle hesaplamalar yapılmıştır.

Kanada Şartnamesi (Canadian Foundation Engineering Manual, 2006)

$q_a \sim Ksp * UCS\ (MPa)$

q_a : İzin verilen taşıma gücü değerleri

UCS : Kayacın ortalama tek eksenli basınç dayanımı ~25 MPa (Tablo 45)

Ksp : 0,10 ila 0,40 arasında değişen ampirik katsayı (Tablo 59)

Buna göre;

$q_a \sim 0{,}10 * 25 \sim 2{,}50$ MPa

olarak hesaplanmıştır.

Peck et.al.

Peck ve diğerleri, Şekil 69'da gösterildiği gibi, bir kaya kütlesinin taşıma kapasitesi üzerinde önemli bir etkiye sahip olan, izin verilen taşıma kapasitesi gerilimi ile RQD arasında ampirik bir korelasyon önermiştir. Korelasyon, "bir inçin (25 mm) kesirinden daha geniş" olan "sıkı veya açık olmayan" süreksizlikleri olan bir kaya kütlesi için tasarlanmıştır. İzin verilen taşıma kapasitesi ile RQD arasındaki ilişki, aşağıdaki formülasyon kullanılarak yaklaşık olarak hesaplanabilir:

$q_a \sim 11{,}74 \times e^{0{,}032x(RQD)}\ (Tsf)$

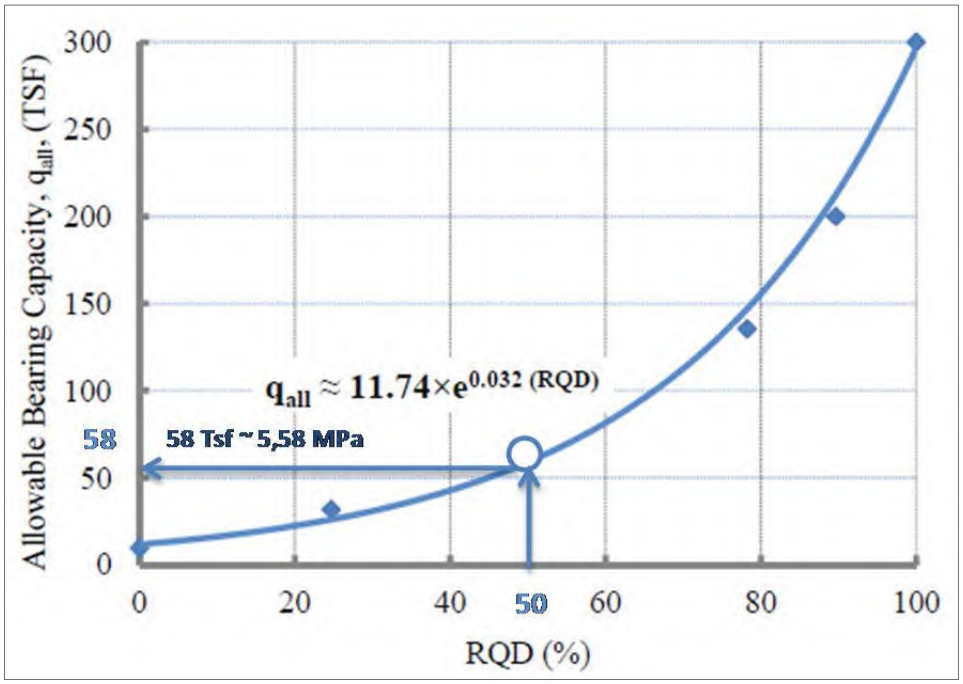
1 Tsf : 0,096MPa

RQD : %50 (Tablo 33)

Şekil 69'a göre;

$q_a \sim 5{,}58$ MPa

olarak hesaplanmıştır.



Şekil 69 Pasa Depolama Sahası İzin Verilen Taşıma Gücü (Peck vd)

Yukarıda verilen iki farklı ampirik yaklaşımla izin verilebilir taşıma gücü değerleri Tablo 63'de özetlenmiştir.

Tablo 63. Pasa Depolama Sahası Tesisi İçin İzin Verilebilir Taşıma Gücü Değerleri

Kanada Şartnamesi			Peck vd.			qa/qall (MPa)		
UCS (MPa)	Ksp	qa/qall (MPa)	RQD (%)	qa/qall		Min.	Maks.	Önerilen
				Tsf	(MPa)			
25,00	0,10	2,50	50	58	5,57	2,50	5,57	2,50
Gerilme		1,00			1,00			1,00

Yapının temele aktardığı gerilme ~ 1,00 MPa (G+Q) olup Karakaya formasyonu (TRkk) için izin verilebilir taşıma gücü minumum ~ 2,50 MPa olarak Tablo 63'de hesaplanmış olup dolayısıyla 1,00 MPa < 2,50 MPa (qt < qa) olduğu için taşıma gücü bakımından bir sorun beklenmez.

➢ Sızıntı Havuzu Taşıma Gücü

Sızıntı havuzu sahasının ana kayası olan Karakaya formasyonu (TRkk) için taşıma gücü içını aşağıda iki farklı yöntemle hesaplamalar yapılmıştır.

Kanada Şartnamesi (Canadian Foundation Engineering Manual, 2006)

$$q_a \sim Ksp * UCS\ (MPa)$$

q_a : İzin verilen taşıma gücü değerleri

UCS : Kayacın ortalama tek eksenli basınç dayanımı ~58 MPa (Tablo 53)

Ksp : 0,10 ila 0,40 arasında değişen ampirik katsayı (Tablo 59)

Buna göre;

$q_a \sim 0{,}10 * 58 \sim 5{,}80$ MPa

olarak hesaplanmıştır.

Peck et.al.

Peck ve diğerleri, Şekil 70'de gösterildiği gibi, bir kaya kütlesinin taşıma kapasitesi üzerinde önemli bir etkiye sahip olan, izin verilen taşıma kapasitesi gerilimi ile RQD arasında ampirik bir korelasyon önermiştir. Korelasyon, "bir inçin (25 mm) kesirinden daha geniş" olan "sıkı veya açık olmayan" süreksizlikleri olan bir kaya kütlesi için tasarlanmıştır. İzin verilen taşıma kapasitesi ile RQD arasındaki ilişki, aşağıdaki formülasyon kullanılarak yaklaşık olarak hesaplanabilir:

$$q_a \sim 11{,}74 \times e^{0{,}032x(RQD)}\ (Tsf)$$

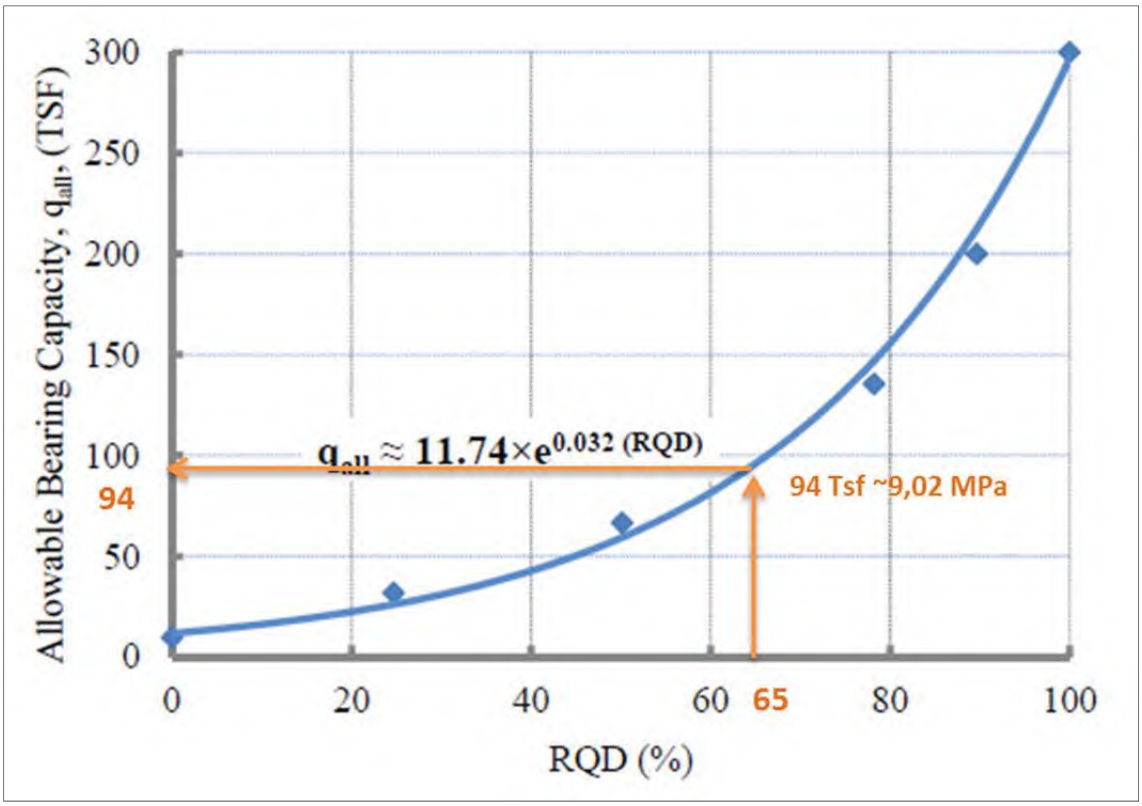
1 Tsf : 0,096MPa

RQD : %65 (Tablo 29)

Şekil 70'e göre;

$q_a \sim 9{,}02$ MPa

olarak hesaplanmıştır.



Şekil 70 Sızıntı Havuzu İzin Verilen Taşıma Gücü (Peck vd)

Yukarıda verilen iki farklı ampirik yaklaşımla izin verilebilir taşıma gücü değerleri Tablo 64'de özetlenmiştir.

Tablo 64. Sızıntı Havuzu Tesisi İçin İzin Verilebilir Taşıma Gücü Değerleri

Kanada Şartnamesi			Peck vd.			qa/qall (MPa)		
UCS (MPa)	Ksp	qa/qall (MPa)	RQD (%)	qa/qall		Min.	Maks.	Önerilen
				Tsf	(MPa)			
58,00	0,10	5,80	65	94	9,02	5,80	9,02	5,80
Gerilme		0,50			0,50			0,50

Yapının temele aktardığı gerilme ~ 0,50 MPa (G+Q) olup Karakaya formasyonu (TRkk) için izin verilebilir taşıma gücü minumum ~5,80 MPa olarak Tablo 64'de hesaplanmış olup dolayısıyla 0,50 MPa < 5,80 MPa (qt < qa) olduğu için taşıma gücü bakımından bir sorun beklenmez.

- **Servis Alanı Taşıma Gücü**

Servis Alanı sahasının ana kayası olan Karakaya formasyonu (TRkk) için taşıma gücü içini aşağıda iki farklı yöntemle hesaplamalar yapılmıştır.

Kanada Şartnamesi (Canadian Foundation Engineering Manual, 2006)

$q_a \sim Ksp * UCS\ (MPa)$

q_a : İzin verilen taşıma gücü değerleri

UCS : Kayacın ortalama tek eksenli basınç dayanımı ~20 MPa (Tablo 56)

Ksp : 0,10 ila 0,40 arasında değişen ampirik katsayı (Tablo 59)

Buna göre;

$q_a \sim 0{,}10 * 20 \sim 2{,}00$ MPa

olarak hesaplanmıştır.

Peck et.al.

Peck ve diğerleri, Şekil 71'de gösterildiği gibi, bir kaya kütlesinin taşıma kapasitesi üzerinde önemli bir etkiye sahip olan, izin verilen taşıma kapasitesi gerilimi ile RQD arasında ampirik bir korelasyon önermiştir. Korelasyon, "bir inçin (25 mm) kesirinden daha geniş" olan "sıkı veya açık olmayan" süreksizlikleri olan bir kaya kütlesi için tasarlanmıştır. İzin verilen taşıma kapasitesi ile RQD arasındaki ilişki, aşağıdaki formülasyon kullanılarak yaklaşık olarak hesaplanabilir:

$q_a \sim 11{,}74 \times e^{0{,}032x(RQD)}\ (Tsf)$

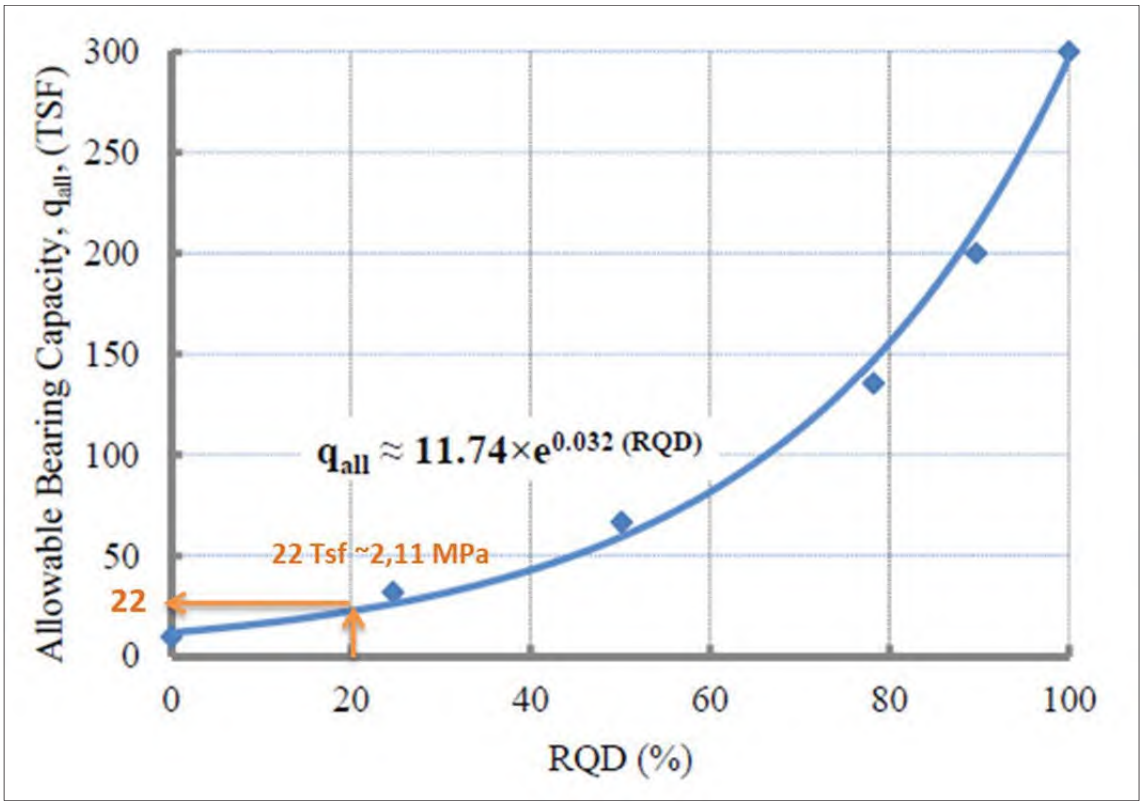
1 Tsf : 0,096MPa

RQD : %20(Tablo 30)

Şekil 71'e göre;

$q_a \sim 2{,}11$ MPa

olarak hesaplanmıştır.



Şekil 71 Servis Alanı İzin Verilen Taşıma Gücü (Peck vd)

Yukarıda verilen iki farklı ampirik yaklaşımla izin verilebilir taşıma gücü değerleri Tablo 65'de özetlenmiştir.

Tablo 65. Servis Alanı İçin İzin Verilebilir Taşıma Gücü Değerleri

Kanada Şartnamesi			Peck vd.			qa/qall (MPa)		
UCS (MPa)	Ksp	qa/qall (MPa)	RQD (%)	qa/qall		Min.	Maks.	Önerilen
				Tsf	(MPa)			
20,00	0,10	2,00	20	22	2,11	2,00	2,11	2,00

Yapının temele aktardığı gerilme ~ 0,50 MPa (G+Q) olup Karakaya formasyonu (TRkk) için izin verilebilir taşıma gücü minumum ~2,00 MPa olarak Tablo 65'de hesaplanmış olup dolayısıyla 0,50 MPa < 2,00 MPa (qt < qa) olduğu için taşıma gücü bakımından bir sorun beklenmez.

9. KAZI VE KAZI SINIFLAMASI

Atık Depolama Tesisi

Talvegde ve çok yakın civadında gözlemsel ve sondaj verilerine göre, kalınlığı 0,50 ila 4,00 m olan ana kayanın, çok-tamamen ayrışmış kesimlerinın kaldırılması önerilir.

Sol ve sağ sahilde rastlanılan rezidüel zemin olarak tanımlanan birimlerin (Bitkisel toprak tabakası dahil) sıyrılması önerilir.

Ayrıca, Yamaç molozuna rastlanılması durumunda kaldırılması önerilir.

Pasa Depolama Sahası

Proje sahasında bitkisel toprak tabasının altında bulunan ana kayanın, çok-tamamen ayrışmış kesimlerinın (~1,0 m.) kaldırılması önerilir.

Proje sahası için kazı klas yüzdeleri Tablo 66'da verilmiştir.

Tablo 66 Kazı klas tablosu

Ünite Adı	Kaya ve Bata k Hariç Her Türlü Zemin Kazısı (%)	Kaya (%)	Sert Kaya (%)
Atık Depolama Tesisi	30	60	10
Pasa Depolama Sahası	10	80	10

10.SONUÇ VE ÖNERİLER

İnceleme alanında Karakaya Formasyonu'na ait Kumtaşı ve Andezit birimler tespit edilmiştir. Formasyon genelinde bolca süreksizlik olup ilk 15,00m 'de düşük 15,00m sonrasında yüksek jeomekanik parametreler gözlenmiştir.

Çalışmalar sırasında kayaçların litolojik özellikleri incelenmiş jeolojik birimler ayırtlanmış ve sahanın 1/5000, 1/1000, 1/500 ölçekli detaylı jeoloji haritası hazırlanmıştır.

Sahada yapılan sondajlara ait karotlar incelenmiş kayaçların litolojik özellikleri tanımlanmıştır.

Atık Depolama Tesisi Jeoteknik Parametreleri

Atık Depolama Tesisi için sağlam kaya parametreleri

Birim Ağırlık (γ_n) (kN/m^3)	Tek Eksenli Dayanım (UCS) (MPa)	Elastisite Modülü (Ei) (GPa)	Poisson Oranı (μ)
25,00	45,00	18	0,27

Temel altı; Atık Depolama Tesisi için kaya kütle parametreleri (D=0)

Kaya Kütlesi Tek Eksenli Basınç Dayanımı	Kaya Malzemesi Tek Eksenli Basınç	Jeolojik Dayanım	Hoek&Brown Sabiti	Elastisite Modülü	Kohezyon	İçsel sürtünme açısı	Deformasyon Modülü
UCS (MPa)	UCS (MPa)	GSI	m_i	Ei (Gpa)	c (MPa)	Ø (°)	E_m (MPa)

Karakayalar Formasyonu (TRkk) için statik yükleme durumu (1,4G+1,6Q) için temelin tasarım dayanımı hesaplanmış ve TBDY Denklem 16.6'ya göre koşulları sağladığı belirlenmiştir.

- Atık Depolama Tesisinin temele aktardığı gerilme ~1,08 MPa (G+Q) olup Karakayalar Formasyonu (TRkk) için izin verilebilir taşıma gücü minumum ~ 2,50 MPa olarak hesaplanmış olup dolayısıyla 1,08 MPa < 2,50 MPa (qt < qa) olduğu için taşıma gücü bakımından bir sorun beklenmez.

- Temiz Su Havuzu temele aktardığı gerilme ~0,25 MPa (G+Q) olup Karakayalar Formasyonu (TRkk) için izin verilebilir taşıma gücü minumum ~ 2,50 MPa olarak hesaplanmış olup dolayısıyla 0,25 MPa < 2,50 MPa (qt < qa) olduğu için taşıma gücü bakımından bir sorun beklenmez.

- Pasa Depolama Sahası temele aktardığı gerilme ~1,00 MPa (G+Q) olup Karakayalar Formasyonu (TRkk) için izin verilebilir taşıma gücü minumum ~ 2,50 MPa olarak hesaplanmış olup dolayısıyla 1,00 MPa < 2,50 MPa (qt < qa) olduğu için taşıma gücü bakımından bir sorun beklenmez.

Anıl KUTLUAY Geoteknik Y. Mühendisi

Seçuk [illegible] Jeoloji Mühendisi Oda Sicil No: 6463

Prof. Dr. Mustafa [illegible] Ankara [illegible] Mühendislik Fakültesi İnşaat Mühendisliği Bölümü

-Proses Tesis Alanı temele aktardığı gerilme ~ 0,75 MPa (G+Q) olup Karakaya formasyonu (TRkk) için izin verilebilir taşıma gücü minumum ~ 1,34 MPa olarak hesaplanmış olup dolayısıyla 0,75 MPa < 1,34 MPa (qt < qa) olduğu için taşıma gücü bakımından bir sorun beklenmez.

-Sızıntı Havuzu temele aktardığı gerilme ~ 0,50 MPa (G+Q) olup Karakaya formasyonu (TRkk) için izin verilebilir taşıma gücü minumum ~5,80 MPa olarak hesaplanmış olup dolayısıyla 0,50MPa < 5,80 MPa (qt < qa) olduğu için taşıma gücü bakımından bir sorun beklenmez.

-Servis Alanı temele aktardığı gerilme ~ 0,50 MPa (G+Q) olup Karakaya formasyonu (TRkk) için izin verilebilir taşıma gücü minumum ~2,00 MPa olarak hesaplanmış olup dolayısıyla 0,50MPa < 2,00 MPa (qt < qa) olduğu için taşıma gücü bakımından bir sorun beklenmez.

Karakayalar Formasyonu (TRkk) birimlerde oturma problemi beklenmemektedir.

Karakayalar Formasyonu (TRkk) birimlerde sıvılaşma problemi beklenmemektedir.

Proje sahasında açılan temel sondaj çalışmaların yapılan BST sonuçlarına göre;

-Proses tesis alanı bölgesinde bulunan Karakaya formasyonu (TRkk) lokal olarak bazı seviyelerinde "Az Geçirimli" özelliğe sahip olmakla birlikte, ağırlıklı olarak "Geçirimli ve Çok Geçirimli" özelliktedir.

- Pasa depolama sahası ana kayası olan Karakaya formasyonu (TRkk) genellikle "Geçirimli" özelliğe sahiptir. Ancak bu bölgede (KGDH25-12 ve KGDH25-13 kuyuları verilerine göre) derinlere doğru özellikle 280 – 310 m kotlarında "Az Geçirimli-Geçirimsiz" özellik kazanmaktadır.

-Atık depolama tesisi bölgesinde açılmış olan kuyularda da Karakaya formasyonu (TRkk) tüm kuyularda ve seviyelerde "Geçirimli" özelliktedir.

-Temiz su havuzu sahasının ana kayasını oluşturan Karakaya (TRkk) formasyonu birimleri "Geçirimli" olarak sınıflandırılmıştır.

-Sızıntı Havuzu sahasının ana kayasını oluşturan Karakaya (TRkk) formasyonu birimleri ≤14,0m ye kadar "Geçirimli" , ≥14,00 m den sonra "Az Geçirimli" olarak sınıflandırılmıştır.

Seçkin Ser... Jeoloji Mühendisi Oda Sicil No: 6463

Prof. Dr. Mu... Ankara Üniversitesi Mühendislik Fakültesi İnşaat Mühendisliği Bölümü

Anıl KUTLUAY Geoteknik Mühendisi

-Servis Alanı sahası ana kayasını oluşturan Karakaya (TRkk) formasyonu birimleri "Geçirimli" olarak sınıflandırılmıştır.

ADT uygulama projesi hazırlanırken hesapların detaylandırılması önerilir.

Türkiye Deprem Tehlike Haritalarından 50 yılda aşılma olasılığı %10 (tekrarlama periyodu 475 yıl) göre inceleme alanının en büyük yer ivmesi (PGA) 0.347 g olarak belirlenmiştir girmektedir. Proje sahasında yapılan jeofizik çalışmalara göre yerel zemin sınıfı ZC ve ZB olarak belirlenmiştir.

Jeofizik ve sahada yapılan 30 adet temel sondaj çalışmalarına göre ünitelere ait yerel zemin sınıflamaları aşağıda verilmiştir.

Ünite yerlerine göre yerel zemin sınıflaması

Ünite Adı	Yerel Zemin Sınıfı
Atık Depolama Tesisi	ZB-ZC
Temiz Su Havuzu	ZC
Proses Tesis Alanı	ZB ve ZC
Pasa Depolama Sahası	ZB ve ZC
Sızıntı Havuzu	ZB
Servis Alanı	ZB

Proje sahası için kazı klas yüzdeleri aşağıda verilmiştir.

Kazı klas tablosu

Ünite Adı	Kaya ve Bata k Hariç Her Türlü Zemin Kazısı (%)	Kaya (%)	Sert Kaya (%)
Atık Depolama Tesisi	30	60	10
Pasa Depolama Sahası	10	80	10

$$k = \frac{q}{FHc}$$

F = Şekil Faktörü (Bknz. Şekil-1)
Hc = Su seviyesi. Sabit su seviyesi test boyunca sağlanan durgun su seviyesinden itibaren ölçülür.

(Kaya Şev Stabiletisi, E.HOEK-J.W.BRAY, Çeviren : Prof. Dr. A.G.PAŞAMEHMETOĞLU, Prof.Dr.A.ÖZGENOĞLU,Prof.Dr.C.KARPUZ)

Geçirgenlik Katsayısı k(cm/sn)	Açıklama
$< 10^{-6}$	Geçirimsiz
10^{-6} - 10^{-5}	Az Geçirimli
10^{-5} - 10^{-4}	Yarı Geçirimli
10^{-4} - 10^{-3}	Geçirimli
$>10^{-3}$	Çok Geçirimli

Taban koşulları		Şekil Faktörü F
	Homojen geçirgenliği olan zemin veya kayada muhafaza borusu sondaj kuyusunun tabanına oturtulur. Muhafaza borusunun iç çapı "d" cm dir.	$F = 2.75d$
	Muhafaza borusu geçirgen ve geçirgen olmayan tabakaların arasındaki sınıra kadar indirilir. Muhafaza borusunun iç çapı "d" cm. dir.	$F = 2.0d$
	Sondaj kuyusu muhafaza borusu sonundan "L" kadar uzatılır. Sondaj kuyusunun çapı "D" dir.	$F = \frac{2\pi L}{\log_e (2L/D)}$ $L > 4D$
	Sondaj kuyusu yatay ve dikey geçirgenliği olan tabakalı zemin veya kaya içindeki muhafaza borusundan "L" kadar uzatılır.	k_h in tayini için $F = \frac{2\pi L}{\log_e (2m\,L/D)}$ burada $m = (k_h/k_v)^{1/2}$, $L > 4D$
	Sondaj kuyusu geçirgen olmayan bir sınıra dayanan muhafaza borusunun sonundan "L" kadar uzatılır.	$F = \frac{2\pi L}{\log_e (4L/D)}$ $L > 4D$

Çamurtaşı(TRkk)
(0,00-22,0m)
boz-kahvemsi, çok ince tabakalı, aşırı zayıf dayanımlı, grafitli, çok-tamamen ayrışmış (yoğun ezik zonlu-killeşmiş), her yönlü bir birini kesen süreksizliğin oluşturduğu zayıf kenetlenmiş kayaç parçalı, çok dar aralıklı, düzlemsel-düz- pürüzsüz, yoğun kil-FeO sıvamalı,

$$k = \frac{q}{FHc}$$

F = Şekil Faktörü (Bknz. Şekil-1)
Hc = Su seviyesi. Sabit su seviyesi test boyunca sağlanan durgun su seviyesinden itibaren ölçülür.

(Kaya Şev Stabiletisi, E.HOEK-J.W.BRAY, Çeviren : Prof. Dr. A.G.PAŞAMEHMETOĞLU, Prof.Dr.A.ÖZGENOĞLU,Prof.Dr.C.KARPUZ)

Geçirgenlik Katsayısı k(cm/sn)	Açıklama
$< 10^{-6}$	Geçirimsiz
10^{-6} - 10^{-5}	Az Geçirimli
10^{-5} - 10^{-4}	Yarı Geçirimli
10^{-4} - 10^{-3}	Geçirimli
$>10^{-3}$	Çok Geçirimli

Taban koşulları		Şekil Faktörü F
	Homojen geçirgenliği olan zemin veya kayada muhafaza borusu sondaj kuyusunun tabanına oturtulur. Muhafaza borusunun iç çapı "d" cm dir.	F = 2.75d
	Muhafaza borusu geçirgen ve geçirgen olmayan tabakaların arasındaki sınıra kadar indirilir. Muhafaza borusunun iç çapı "d" cm. dir.	F = 2.0d
	Sondaj kuyusu muhafaza borusu sonundan "L" kadar uzatılır. Sondaj kuyusunun çapı "D" dir.	$F = \frac{2\pi L}{Log_e (2L/D)}$ L > 4D
	Sondaj kuyusu yatay ve dikey geçirgenliği olan tabakalı zemin veya kaya içindeki muhafaza borusundan "L" kadar uzatılır.	k_h in tayini için $F = \frac{2\pi L}{Log_e (2m\ L/D)}$ burada $m = (k_h/k_v)^{1/2}$, L > 4D
	Sondaj kuyusu geçirgen olmayan bir sınıra dayanan muhafaza borusunun sonundan "L" kadar uzatılır.	$F = \frac{2\pi L}{Log_e (4L/D)}$ L > 4D

$$k = \frac{q}{FHc}$$

F = Şekil Faktörü (Bknz. Şekil-1)
Hc = Su seviyesi. Sabit su seviyesi test boyunca sağlanan durgun su seviyesinden itibaren ölçülür.

(Kaya Şev Stabiletisi, E.HOEK-J.W.BRAY, Çeviren : Prof. Dr. A.G.PAŞAMEHMETOĞLU, Prof.Dr.A.ÖZGENOĞLU,Prof.Dr.C.KARPUZ)

Geçirgenlik Katsayısı k(cm/sn)	Açıklama
$< 10^{-6}$	Geçirimsiz
$10^{-6} - 10^{-5}$	Az Geçirimli
$10^{-5} - 10^{-4}$	Yarı Geçirimli
$10^{-4} - 10^{-3}$	Geçirimli
$>10^{-3}$	Çok Geçirimli

Taban koşulları		Şekil Faktörü F
	Homojen geçirgenliği olan zemin veya kayada muhafaza borusu sondaj kuyusunun tabanına oturtulur. Muhafaza borusunun iç çapı "d" cm dir.	$F = 2.75d$
	Muhafaza borusu geçirgen ve geçirgen olmayan tabakaların arasındaki sınıra kadar indirilir. Muhafaza borusunun iç çapı "d" cm. dir.	$F = 2.0d$
	Sondaj kuyusu muhafaza borusu sonundan "L" kadar uzatılır. Sondaj kuyusunun çapı "D" dir.	$F = \frac{2\pi L}{\log_e (2L/D)}$ $L > 4D$
	Sondaj kuyusu yatay ve dikey geçirgenliği olan tabakalı zemin veya kaya içindeki muhafaza borusundan "L" kadar uzatılır.	k_h in tayini için $F = \frac{2\pi L}{\log_e (2m\,L/D)}$ burada $m = (k_h/k_v)^{1/2}$, $L > 4D$
	Sondaj kuyusu geçirgen olmayan bir sınıra dayanan muhafaza borusunun sonundan "L" kadar uzatılır.	$F = \frac{2\pi L}{\log_e (4L/D)}$ $L > 4D$

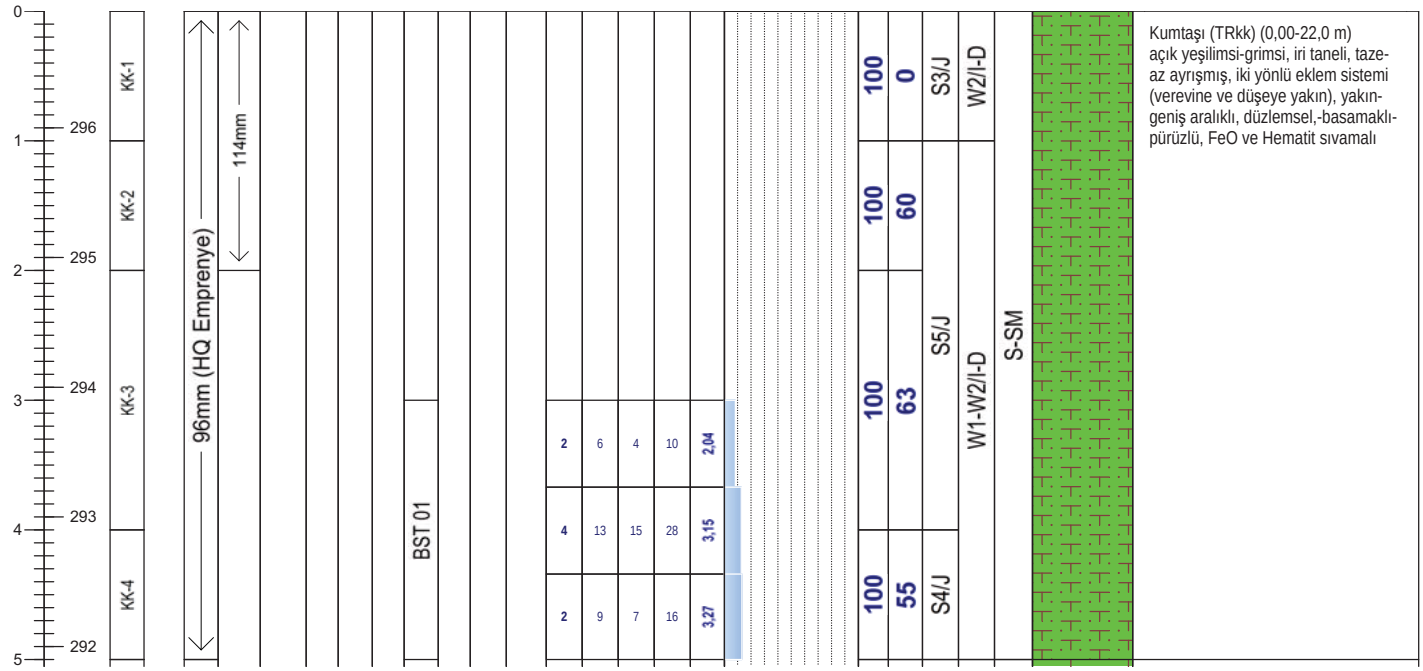
YAAS DURUMU

TARİH	DERİNLİK (m)
10.3.2025	13,0 m
16.3.2025	13,0 m
20.3.2025	13,0 m
23.3.2025	13,0 m
28.3.2025	13,0 m
4.4.2025	13,0 m



Geçirimlilik (Lugeon l/m/dk)

Lugeon l/m/dk	*Kaya tipi*
K1 <1	Geçirimsiz
K2 1-5	Az geçirimli
K3 5-25	Geçirimli
K4 >25	Çok geçirimli

Geçirimlilik (k) (cm/s)

10E 02 - 1,00	Aşırı Geçirimli
10E-01-10E-04	Geçirimli
10E-05-10E-6	Yarı Geçirimli
>10E-06	Geçirimsiz

STANDART PENETRASYON DENEYI

INCE DANELI		*KABA DANELI*	
N : 0 - 2	Çok yumusak	*N : 0 - 4*	Çok gevsek
N : 3 - 4	Yumusak	*N : 5 - 10*	Gevsek
N : 5 - 8	Orta kati	*N : 11 - 30*	Orta siki
N: 9 - 15	Kati	*N : 30 -50*	Siki
N : 16 - 30	Çok kati	*N > 50*	Çok siki
N > 30	Sert		

Ayrışma Derecesi (ISRM, 1981)

W1	Taze
W2	Az Ayrışmış
W3	Orta Derecede Ayrışmış
W4	Çok Ayrışmış
W5	Tamamen Ayrışmış
W6	Artık Zemin

Kaya Dayanımı (ISRM, 1981)

R1 Aşırı Zayıf	UCS= 0,25 - 1 MPa
R2 Çok Zayıf	UCS= 1.0 - 5.0 MPa
R3 Zayıf	UCS= 5.0 - 25 MPa
R4 Orta Sağlam	UCS= 25- 50 MPa
R5 Sağlam	UCS= 50-100 MPa
R6 Çok Sağlam	UCS= 100 - 250 MPa
R7 Aşırı Sağlam	UCS >250 Mpa

Süreksizlik Aralığı (mm) (ISRM, 1981)

S1 <20 Çok Dar Aralıklı
S2 20-60 Dar Aralıklı
S3 60-200 Yakın Aralıklı
S4 200-600 Orta Drc. Aralıklı
S5 600-2000 Geniş Aralıklı
S6 2000-6000 Çok Geniş Aralıklı
S7 >6000 İleri Drc. Geniş Aralıklı

$$k = \frac{q}{FHc}$$

F = Şekil Faktörü (Bknz. Şekil-1)
Hc = Su seviyesi. Sabit su seviyesi test boyunca sağlanan durgun su seviyesinden itibaren ölçülür.

(Kaya Şev Stabiletisi, E.HOEK-J.W.BRAY, Çeviren : Prof. Dr. A.G.PAŞAMEHMETOĞLU, Prof.Dr.A.ÖZGENOĞLU,Prof.Dr.C.KARPUZ)

Geçirgenlik Katsayısı k(cm/sn)	Açıklama
$< 10^{-6}$	Geçirimsiz
$10^{-6} - 10^{-5}$	Az Geçirimli
$10^{-5} - 10^{-4}$	Yarı Geçirimli
$10^{-4} - 10^{-3}$	Geçirimli
$>10^{-3}$	Çok Geçirimli

Taban koşulları		Şekil Faktörü F
	Homojen geçirgenliği olan zemin veya kayada muhafaza borusu sondaj kuyusunun tabanına oturtulur. Muhafaza borusunun iç çapı "d" cm dir.	$F = 2.75d$
	Muhafaza borusu geçirgen ve geçirgen olmayan tabakaların arasındaki sınıra kadar indirilir. Muhafaza borusunun iç çapı "d" cm. dir.	$F = 2.0d$
	Sondaj kuyusu muhafaza borusu sonundan "L" kadar uzatılır. Sondaj kuyusunun çapı "D" dir.	$F = \frac{2\pi L}{\log_e (2L/D)}$ $L > 4D$
	Sondaj kuyusu yatay ve dikey geçirgenliği olan tabakalı zemin veya kaya içindeki muhafaza borusundan "L" kadar uzatılır.	k_h in tayini için $F = \frac{2\pi L}{\log_e (2m\,L/D)}$ burada $m = (k_h/k_v)^{1/2}$, $L > 4D$
	Sondaj kuyusu geçirgen olmayan bir sınıra dayanan muhafaza borusunun sonundan "L" kadar uzatılır.	$F = \frac{2\pi L}{\log_e (4L/D)}$ $L > 4D$

Kumtaşı (TRkk)
(0,00-4,00m)
Açık mavimsi renkli, çok ince taneli, az ayrışmış, üç yönlü eklem sistemi, Jset1: 10-45", Jset2: Yarı düşey-60", Jset3: 60-85", yakın aralıklı, basamaklı-pürüzlü, düzlemsel,yoğun FeO boyamalı

Kumtaşı (TRkk)
(4,00-10,0m)
Açık mavimsi, ince taneli, taze, geniş aralıklı, basamaklı-pürüzlü, düzlemsel, <1,00 cm kalınlığında çok seyrek düzensiz kalsit damarlı

Geçirimlilik (Lugeon l/m/dk)

Lugeon l/m/dk	Kaya tipi
K1 <1	Geçirimsiz
K2 1-5	Az geçirimli
K3 5-25	Geçirimli
K4 >25	Çok geçirimli

Geçirimlilik (k) (cm/s)

10E 02 - 1,00	Aşırı Geçirimli
10E-01-10E-04	Geçirimli

ÖZET

Bu Rapor, Balıkesir ili, Balya İlçesi 201900265 (ER:3372769) ve 202201688 (ER:3421641) Ruhsat Numaralı Sahalarda Karlık Altın-Gümüş Madeni Açık ve Yeraltı Ocakları, Cevher Zenginleştirme Tesisi (Tank Liçi, ADR, Kırma-Eleme Tesisi), Atık Depolama Tesisi, (Beton Santralleri ve Mobil Kırıcı Dahil) Projesi (Proje) ÇED Raporu Kapsamında Alanın Depremselliği ve Sismik Tehlike Analizi hakkındaki danışmanlık çalışmalarını kapsar.

Bu kapsamda, "Dokuz Eylül Üniversitesi Deprem Araştırma ve Uygulama Merkezi (DAUM)" ile "Altınordu Madencilik Sanayi ve Ticaret A.Ş. (Altınordu)" arasında imzalanan protokol gereğince düzenlenen bu raporda, ÇED Alanı ve Çevresini kapsayacak şekilde literatür tarama çalışmaları, hem bölgesel hem de sahaya özgün yapılan ölçümler ve arazi gözlemleri birleştirilerek bu danışmanlık raporu hazırlanmıştır.

Bu kapsamda yapılan çalışmaların sonucunda sahaya özgün sismik tehlike analizi için kullanılacak sismik kaynağın ruhsat alanına ruhsat alanına uzaklığı ortalama 11 km. ve uzunluğu da ortalama 84 km olan Havran Balya Fay Zonu olduğuna karar verilmiştir. Ruhsat alanında yapılan raporda Sismik Tehlike Analizi çalışmasının izlencesi aşağıdaki gibi uygulanmıştır.

- Ruhsat sahası ve çevresindeki bölgesel ve yerel jeolojik ve depremsellikle ilgili literatür çalışmaları yapıldı.
- Aletsel ve tarihsel deprem verileri ortalama 100km. Yarıçaplı alan için düzenlendi.
- Yakın ve uzak alan deprem kaynak haritası oluşturuldu.
- Arazide çalışma alanı ve çevresindeki jeolojik yapılarda gözlem ve incelemeler yapıldı.
- Deterministik ve Olasılıksal Sismik Tehlike Analizleri yapıldı.
- Sahaya özgün sismik tehlike analizi için ruhsat alanının yerel zemin sınıflamasına yönelik arazi ölçüm ve gözlem çalışmaları yapıldı.

- Arazi ölçümleri için, ruhsat alanında 14 noktada tek nokta mikrotremor ölçümleri yapılarak gözlemsel zemin transfer spektrumları (HVSR(f)) elde edilmiştir. Elde edilen HVSR(f) spektrumlarından 14 nokta için hesaplanan Vs30 hız değerlerinden TBDY 2018 kapsamında tanımlanan zemin tipleri belirlenmiştir.
- Eski nesil ivme azalım ilişkileri kullanılarak ortalama PGA değerleri hesaplanmıştır.
- Sahaya özgün değerlendirme yapmak için, Havran-Balya Fay zonu ve Vs30 hız değerlerinin yeni nesil ivme azalım ilişkilerinde kullanıldığı Graizer, V. ve Kalkan, E. (2016) çalışmasında, her bir ölçüm noktası için %5 sönüm oranı kullanılarak hesaplanan Pseudospectral Acceleration Response Spectrum grafikleri elde edilmiştir.

1. GİRİŞ

1.1. Raporun Amacı ve Kapsamı

Bu Rapor, Balıkesir ili, Balya İlçesi 201900265 (ER:3372769) ve 202201688 (ER:3421641) Ruhsat Numaralı Sahalarda Karlık Altın-Gümüş Madeni Açık ve Yeraltı Ocakları, Cevher Zenginleştirme Tesisi (Tank Liçi, ADR, Kırma-Eleme Tesisi), Atık Depolama Tesisi, (Beton Santralleri ve Mobil Kırıcı Dahil) Projesi (Proje) ÇED Raporu Kapsamında Alanın Depremselliği ve Sismik Tehlike Analizi hakkındaki danışmanlık çalışmalarını kapsar.

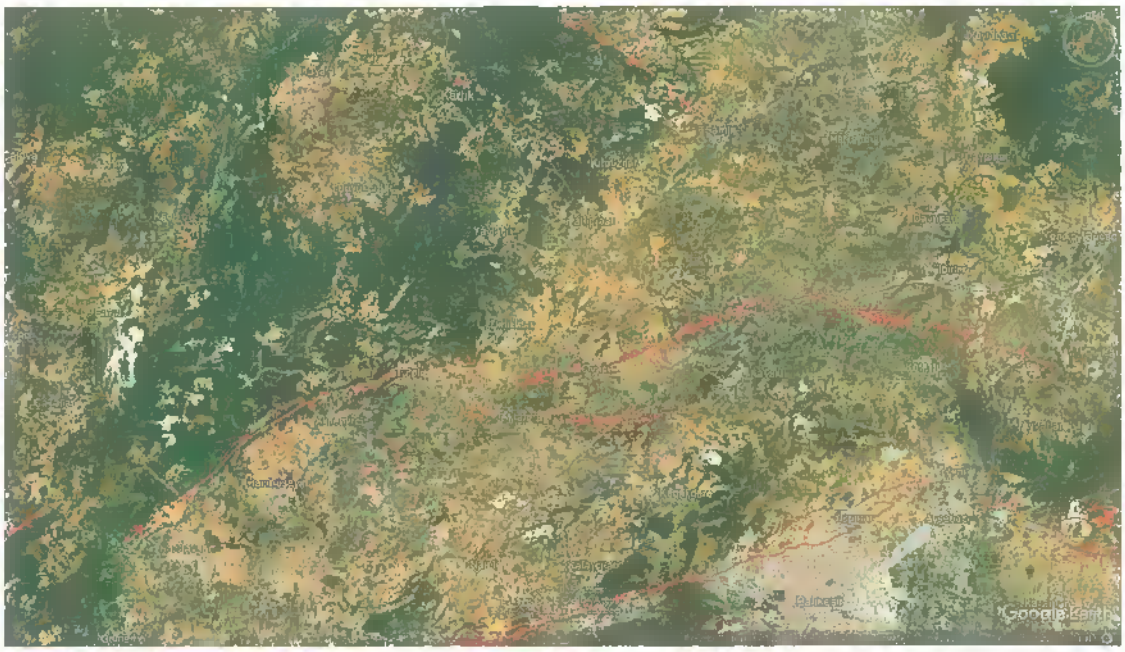
Bu kapsamda

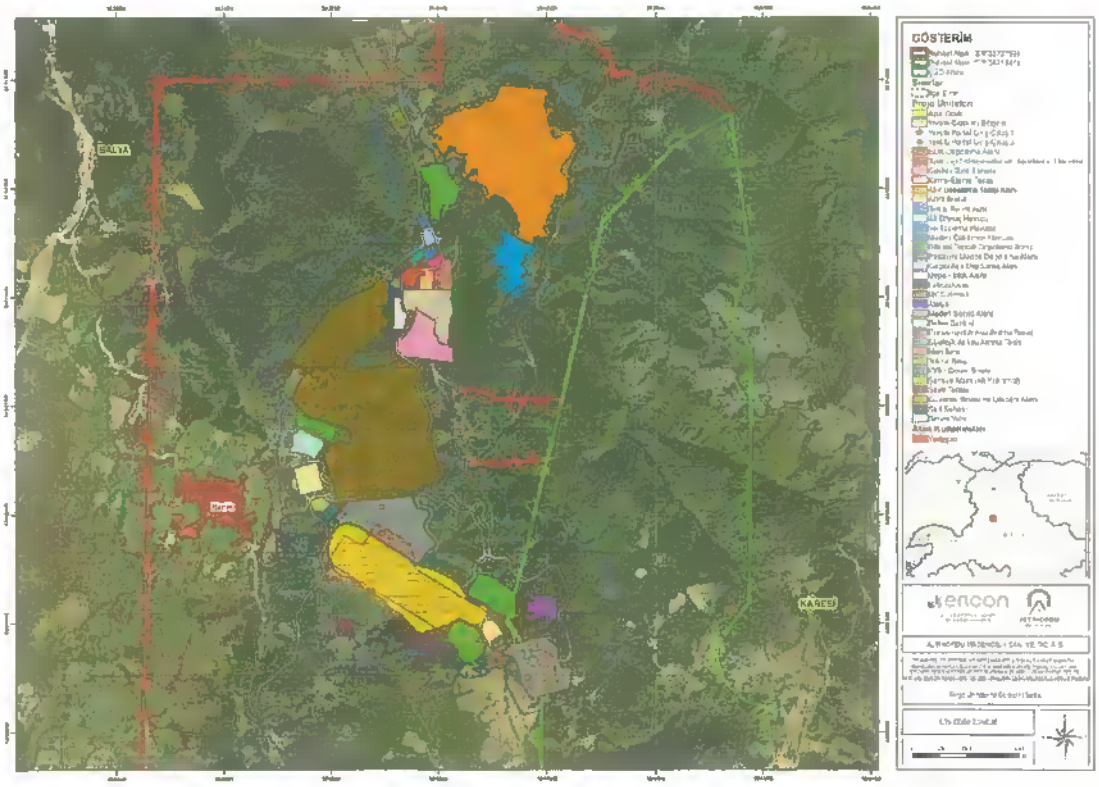
- Proje yeri ve özelliklerinin incelenmesi ile bölgesel tektonik yapısının tanımlanması,
- Proje yeri ve çevresinin tektoniğinin araştırılması ile sismik kaynak tanımlaması,
- Olası bir depremin tesisler üzerindeki hasar riski tespitlerinin araştırılması,
- Standart ve sahaya özgün koşullarda sismik tehlike analizi çalışmalarının yapılması
- Magnitüd frekans bağıntısının tanımlanması,
- Katalog ve haritaların oluşturulması
- Poisson olasılık dağılımında deprem tehlike analizi
- Probabilistik deprem tehlike analizi ve ivme kestirimi
- Azalım ilişkileri ve ivme kestirimi
- Deterministik deprem tehlike analizi ve ivme kestirimi
- Deprem verileri ve risk analiz çalışmaları
- Olası depremin enerji kestirimi
- Tasarım depremi modellemesi ve ünitelere etki limitleri
- Maksimum dizayn depreminin dizaynı
- İşletmeye esas deprem dizaynı

olarak tanımlanmıştır.

1.2 İnceleme Alanı

Karlık Sahası, Balıkesir İl sınırları içerisinde, Balya İlçesi, Karlık Söbücealan çevresinde bulunmaktadır (Şekil 1.1). ÇED alanı Balıkesir il merkezinin kuş uçuşu yaklaşık 22 km Kuzey Batısında, ve Balya ilçe merkezine yaklaşık 15 km mesafededir. Karlık Altın-Gümüş Madeni Açık ve Yeraltı Ocakları, Cevher Zenginleştirme Tesisi (Tank Liçi, ADR, Kırma-Eleme Tesisi), Atık Depolama Tesisi, (Beton Santralleri ve Mobil Kırıcı Dahil) Projesi (Proje) ÇED Raporu Kapsamında yerleşim alanı Şekil 1.1'de gösterildiği şekilde planlanmıştır.





Şekil 1.1 İnceleme alanını ve Karlık Altın-Gümüş Madeni Açık ve Yeraltı Ocakları, Cevher Zenginleştirme Tesisi (Tank Liçi, ADR, Kırma-Eleme Tesisi), Atık Depolama

Tesisi, (Beton Santralleri ve Mobil Kırıcı Dahil) Projesi (Proje) ÇED Raporu Kapsamında yerleşim alanlarını Gösterir Google Earth görüntüsü

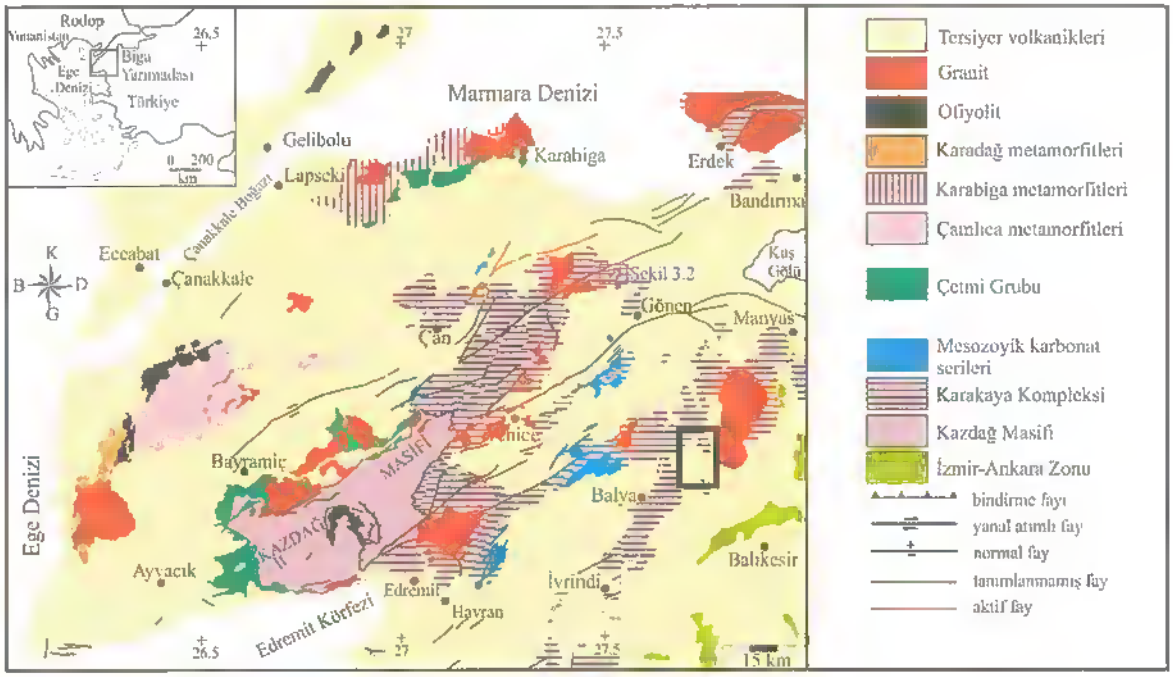
2. BÖLGESEL JEOLOJİ ve AKTİF TEKTONİK

İnceleme alanının içinde bulunduğu Alp-Himalaya çarpışma kuşağı içerisinde yer alan Türkiye'de çok evreli jeolojik olaylar nedeniyle farklı orojenik kuşaklar gelişmiştir (Şekil 2.1). Bu kuşaklar genel hatlarıyla, kuzeyde Sakarya Bloğu ve Pontidlerle temsil edilen Lavrasya kıtasının güneyde Torid-Anatolid bloğu ile temsil edilen Gondvana kıtasıyla Kretase-Tersiyer'de çarpışması sonucunda şekillenmiştir (Şengör, 1979; Şengör & Yılmaz, 1981; Okay, 1984, 1985, 2000; Ustaömer & Robertson, 1997; Okay & Tüysüz, 2000).

Şekil 2.1. Türkiye'nin tektonik birlikleri (Şengör ve Yılmaz, 1981; Okay ve Tüzsüz, 1999).

Anatolid bloğu, Toridlerin kuzeydeki metamorfik devamıdır ve birlikte, Paleozoyik-Mesozoyik dönemlerinde Gondvana kıtasının kuzey kenarında oluşan sığ denizel bir platformu oluşturmaktadır (Şengör, 1979). Daha sonra gelişen Alpin orojenezinde bu platform naplar halinde parçalanmış ve kuzeyde kalan kesimi metamorfizmaya uğramıştır. Anatolid Bloğundaki farklı metamorfizma derecelerini

yansıtan kesimler; Tavşanlı Zonu, Afyon Zonu ve Menderes Masifi gibi farklı tektonik bölümlere ayrılmıştır. Pontidler ise, yine tektonik konum ve deformasyon dereceleri bakımından, kendi içerisinde Sakarya ve İstanbul Zonu gibi alt tektonik bölümlerde incelenmiştir (Şekil 2.1 ve 2.2). Bu tektonik çatı içerisinde, o dönem Pontidleri Analolid-Toridlerden ayıran Tetis Okyanusu, bugün bu iki kıta arasındaki İzmir-Ankara(-Erzincan) Süturu ve Anatolid-Torid bloğu üzerinde yaygın bir şekilde gözlenen ofiyolitik kütleler ile temsil edilmektedir. Söz konusu çarpışmanın ürünleri olarak tanımlanan bu orojenik kuşaklar boyunca, jeolojik konumları birbirinden farklı olan ve farklı metamorfizma/deformasyon dereceleri simgelenen bazı ana tektonik birlikler tanımlanmıştır. Çalışma Alanı ve yakın çevresinde bu birliklerden Pontid Bloğu ve Anatolid-Torid Blokları yüzlek vermektedir (Şekil 2.1 ve 2.2). Bu tektonik birlikler ilgili literatür (Şengör, 1979; Şentürk ve Karaköse, 1981; Şengör & Yılmaz, 1981; Okay, 1984, 1985, 2000; Genç & Yılmaz, 1995; Ustaömer & Robertson, 1997; Okay & Tüysüz, 1999; Okay & Göncüoğlu, 2004; Candan vd., 2011; Ustaömer vd., 2012; Plunder vd., 2016; Topuz vd., 2018) ışığında derlenmiş ve aşağıda kısaca özetlenmiştir.



Şekil 2.2. KB Anadolu'daki tektonik birliklerin dağılımını ve çalışma alanının bu çatı içerisindeki konumunu gösteren bölgesel jeolojik harita (Okay vd., 1994; Okay, 2010; Ustaomer vd., 2012). Siyah dikdörtgen Karlık Ruhsat sahasının içinde bulunduğu inceleme alanını göstermektedir.

2.1. Tektonik Birlikler

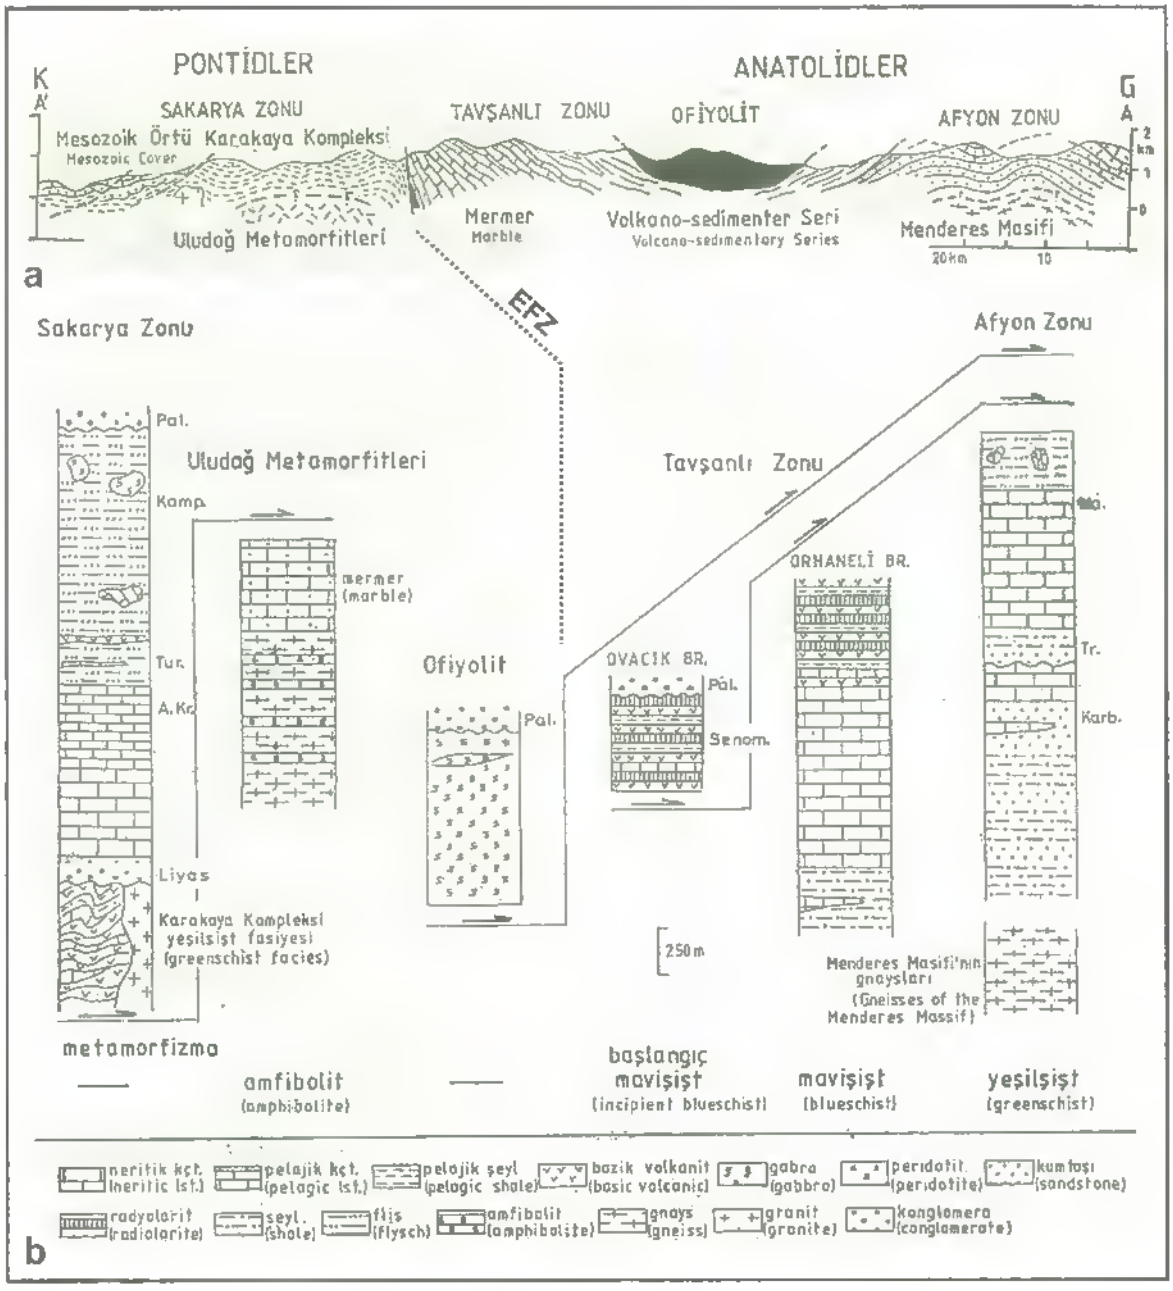
2.1.1. Pontid Bloğu

Pontidler, Paleozoyik-Erken Mesozoyik dönemi için metamorfizması, magmatizması ve tektonik ortamı bakımından birbirlerinden farklı, birbirlerine yabancı kıtasal ve okyanusal birliklerin bir araya gelmesinden oluşan büyük bir tektonik birliktir (Şengör vd., 1984; Okay, 1984; Okay ve Tüysüz, 1999). Türkiye'nin KB'sinde Pontidlere ait iki tektonik zon yer alır. Bunlar kuzeyden güneye doğru İstanbul ve Sakarya Zonu olarak tanımlanır (Okay, 1984; Okay ve Tüysüz, 1999). İstanbul Zonu, batısında Istranca Masifi, doğusunda ve kuzeyinde Sakarya Zonu ile sınırlanır. İstanbul-Kastamonu arasında yer alan bu zon Prekambriyen bir temel üzerinde yer alan Paleozoyik çökellerinden ve bunları uyumsuzlukla örten Triyas çökelleri ile Kretase volkanik ve çökel kayalarından oluşur (Kaya, 1973; Özgörüş & Okay, 2005). Bu topluluk Orta Eosen sonrasında yeni bir çökel topluluğu ile örtülür. İstanbul Zonu Gebze'nin kuzeydoğusunda ise Paleozoyik yaşlı çökellerden oluşmaktadır (Ustaömer & Kıpman, 1998).

Sakarya Zonu yaklaşık olarak Şengör ve Yılmaz (1981) tarafından tanımlanan Sakarya Kıtası'na karşılık gelmekte, genel özellikleri ile metamorfizmaya ve yüksek dereceli deformasyona uğramış Permo-Triyas yaşlı kayaçlar olarak tanımlanmaktadır (Okay, 1984, 1985, 2000). Sakarya Zonu'nun stratigrafisi üzerine yoğunlaşan çalışmalar, zon içinde yüzlek veren birimleri 3 alt başlık altında toplanmıştır. Bunlar sırasıyla, Uludağ Metamorfikleri, Karakaya Kompleksi ve Mesozoyik Örtü Kayaçlarıdır (Okay, 1984; Duru vd., 2012, Şekil 2.3).

Sakarya Zonu içerisindeki orta-yüksek dereceli metamorfik temel kayaçları temsil eden Uludağ Masifi, Bursa'nın güneyindeki Uludağ yükselimine karşılık gelir (Şekil 2.1 ve 2.2). Bu alanda Karakaya Kompleksini oluşturan düşük dereceli yeşil şist fasiyesinde metamorfizmaya uğramış spilit, kireçtaşı ve şeyllerin altından, tektonik bir dokanakla mermer, gnrays ve amfibolitlerden oluşmuş yüksek dereceli metamorfizma ürünleri yüzlek verir (Okay, 1984; Okay vd., 2008). İstif altta gnays ve amfibolit ardalanması ile başlar, üste doğru ise kalın mermerlere geçer. Uludağ Masifi'nin yüzeyleme süreci son yapılan çalışmalarla bir makaslama zonunun varlığı ile açıklanmaktadır (Okay vd., 2008). Sakarya Zonu içerisindeki (Kazdağ Masifi gibi) diğer çekirdek komplekslerinden farklı olarak sağ yanal doğrultu atımlı fay

karakterine sahip ve yüksek açılı bir konuma sahip olan bu makaslama zonu ile ilişkili yüzeyleme sırasında tüm metamorfik istif, Oligosen yaşlı bir granitik kütle ile kesilmektedir (Okay & Satır, 2000; Okay vd., 2008).

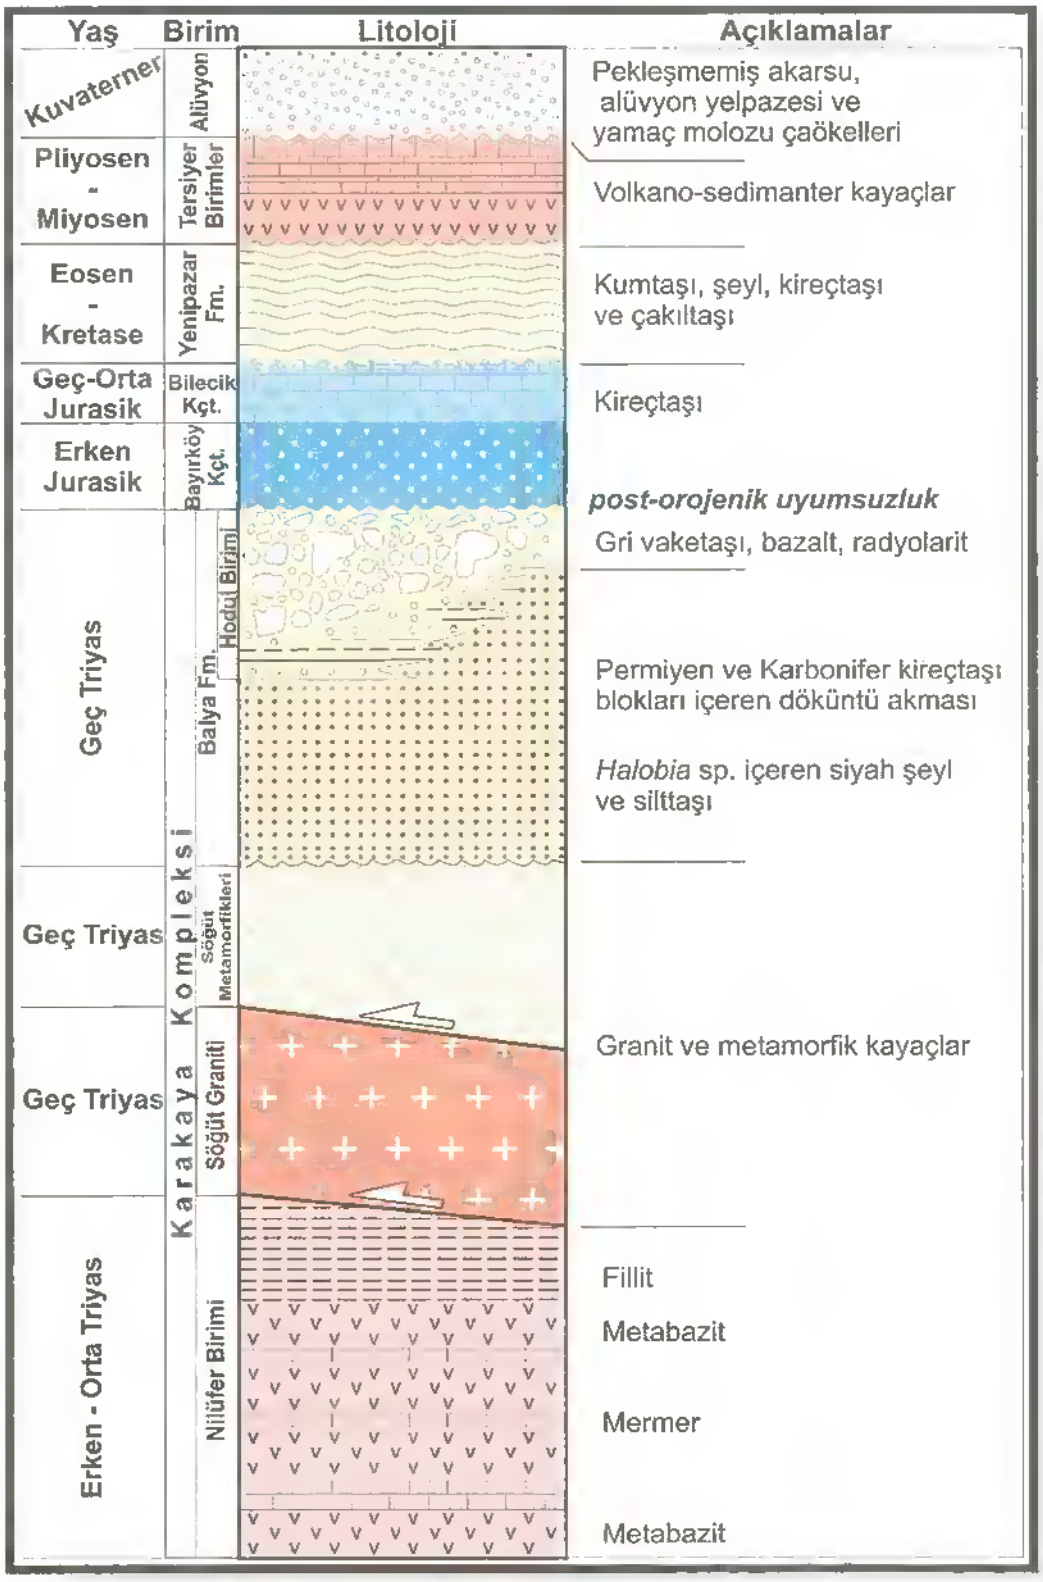


Şekil 2.3. Kuzeybatı Anadolu'daki tektonik birliklerin stratigrafileri ve yanal yöndeki ilişkilerini gösteren (a) enine jeolojik kesit ve (b) dikme kesitler (Okay, 1984, 1985).

Sakarya Zonu içerisindeki tektonik birliklerden bir diğeri olan Karakaya Kompleksi ilk kez Bingöl, 1968 ve Bingöl vd. 1973'te Biga Yarımadası'nda, "Permo-Karbonifer yaşlı egzotik kireçtaşı blokları kapsayan, düşük derecede metamorfizma geçirmiş, Erken Triyas yaşlı kırıntılı çökeller ve metaspilit, spilitik bazalt ve diyabaz karmaşığı olarak adlandırılmış ve tanımlanmıştır. Batıda Biga Yarımadası'ndan doğuda Bilecik civarına kadar Karakaya Kompleksi adı altında değerlendirilmiş birçok jeolojik birim bulunur (Şekil 2.1, 2.2 ve 2.3). Bunlar detaylı bir şekilde Okay (1984), Okay vd. (1998, 2008), Okay & Altıner (2004), Okay & Göncüoğlu (2004) ile Duru vd. (2012) tarafından çalışılarak değerlendirilmiştir. Bu çalışmacılar, Karakaya Kompleksinin içerisinde formasyon mertebesinde ayrılabilecek farklı türde litolojilerin yer aldığı kayaçlar topluluğundan meydana geldiğini bildirirler. Araştırıcılara göre, tanımladıkları formasyonların ilksel stratigrafik ilişkilerini yer yer saptayabilmekte, fakat daha çok bu dokanakların, sonradan gelişen deformasyon nedeniyle çoğunlukla tektonik olarak gözlendiğini vurgulamaktadır. Duru vd. (2012) Biga Yarımadası civarında, Karakaya Kompleksi içindeki bazı formasyonlardan ve egzotik kireçtaşı bloklarında saptadıkları paleontolojik bulguları değerlendirerek birimin yaşının en geç Permiyen (Culfiyen)-Orta Triyas aralığında olması gerektiğini savunur. Bilecik civarında yüzlek veren Karakaya Kompleksine ait kayaçlar ise başlıca; bazik volkanikler, kireçtaşları, şeyller ve kumtaşlarından oluşan bir istifin metamorfizmaya ve/veya yüksek dereceli deformasyona uğramış ürünleri olarak gözlenmektedir. Bu istif içerisindeki kireçtaşlarından Üst Permiyen ve Alt Triyas yaşlı fosil bulguları rapor edilmiştir (Sungur, 1973). Birimin ana deformasyonu yüksek basınç yeşil şist fasiyesi ile simgelenmekte, ve yaşı Triyas olarak vurgulanmaktadır (Şengör & Yılmaz, 1981; Okay, 1984, 1985, 2000; Genç & Yılmaz, 1995; Ustaömer & Robertson, 1997; Okay & Tüysüz, 1999; Candan vd., 2011; Ustaömer vd., 2012).

Karakaya Kompleksi

İlk kez Bingöl ve diğ. (1973) tarafından Biga Yarımadası' nda Permo-Karbonifer yaşlı ekzotik kireçtaşı blokları kapsayan, hafif metamorfizma geçirmiş, Erken Triyas yaşlı çakıltaşı, feldispatlı kumtaşı, kuvarsit, silttaşı, sleyt, radyolarit, çamurtaşı, metaspilit, spilitik bazalt ve dişyabaz karmaşığı Karakaya Formasyonu olarak adlandırılmış ve tanımlanmıştır (Kanar ve diğ., 2013, Şekil 2.4).



Şekil 2.1 Ruhsat alanı ve çevresinin genelleştirilmiş kolon kesiti (Okay 1984, Ustaömer vd., 2012, Duru vd., 2012'den yararlanılarak).

Daha sonraki çalışmalarda, Sakarya zonu temelinde yer alan Karakaya Kompleksi litolojilerinin Anadolu' da Biga Yarımadası' ndan Erzincan' a kadar uzanan geniş bir kuşak içerisinde yayılım gösterdiği belirtilmektedir (Bingöl ve diğ., 1975; Okay ve Göncüoğlu, 2004). Yapılan çalışma alanı içerisinde gözlenen ve Karakaya Kompleksine ait olan Nilüfer birimi ve Hodul birim Okay ve diğ. (1990) tarafından adlandırılmıştır. Bu birimlerden ileride detaylı olarak bahsedilecektir.

Karakaya Kompleksi, içerisinde formasyon mertebesinde ayrılabilecek farklı türde litolojilerin yer aldığı kayaçlar topluluğundan meydana gelmektedir. Bu formasyonların ilksel ilişkilerinin sedimanter dokanaklı olduğu yer yer saptanmakla birlikte, daha sonradan gelişen deformasyon sebebiyle çoğunlukla tektonik dokanaklı olarak görülmektedir. İçerisinde düzenli bir stratigrafik istiflenmeden daha çok tektono-stratigrafik istiflenmenin görüldüğü farklı litolojiler topluluğu, Karakaya Kompleksi olarak tanımlanmıştır (Kanar ve diğ., 2013). Karakaya Kompleksi içerisinde litolojik farklılıklar dikkate alınarak, yer yer çört mercekli, kahve-boz renkli grovaklar Orhanlar grovakı, yeşil renkli bazaltik kayaçlar ve tüfler Mehmetalan Formasyonu, kahve-haki renkli spilitik bazalt, aglomera ve tüflerin yoğun olduğu kesimler Çal Formasyonu, kırıntılıların yoğun olduğu kesimlerde Karakaya Formasyonu ve birimin üst seviyelerinde gözlenen rekristalize kireçtaşları ise Camialan kireçtaşı olarak ayırtlanmıştır (Kanar ve diğ. 2013).

2.1.2. Anatolid-Torid Bloğu

Bu tektonik blok kendi içerisinde birçok tektonik birlikten oluşur. Çalışma alanı yakın çevresinde ise bunlar, kuzeyden güneye; Tavşanlı Zonu, Afyon Zonu ve Menderes Masifi olarak tanımlanan ve mavişistten yeşilşiste uzanan bir metamorfizma derecesine geçen zonlar ile simgelenir (Şekil 2.1 ve 2.2). *Tavşanlı Zonu*, Kuzeybatı Anadolu'da İzmir-Ankara-Erzincan kenet süturu güneyinde, ofiyolit kütlelerin altında yer alan yüksek basınç düşük sıcaklık metamorfizması geçirmiş büyük bir zon bulunmaktadır. Bu zon Tavşanlı Zonu olarak adlandırılmaktadır. Tavşanlı Zonu'nun Anatolidlere dahil olduğunu ve ilksel olarak Anatolid-Torid platformunun en kuzey kesimini oluşturduğu düşünülmektedir. Tavşanlı Zonu Orhaneli'den Yunak'a kadar 350 km uzunluğunda ve 50-100 km genişliğinde yüzeylemektedir. Güneye doğru Afyon Zonu'nun Üst Kretase-Paleosen karbonat ve filişi üzerine itilmiştir. Tavşanlı

Zonu'nu oluşturan kayalar iki grupta incelenebilir (Okay, 1982). Bunlardan birincisi yüksek basınç düşük sıcaklık metamorfizması geçirmiş volkano-sedimanter seri (Ovacık Birliği), ikincisi bölgesel metamorfizma geçiren ve düzenli bir stratigrafik istif sunan mavişistlerdir (Orhaneli Birliği).

Kuzeyde Tavşanlı Zonu ile güneyde Menderes Masifi ve Toridler arasında yüzeyleyen *Afyon Zonu*, Balıkesir'in doğusundan başlayan ve Kütahya ve Afyonu içerisine alarak Konya'nın doğusunda son bulan KD-GM uzanımlı bir kuşak boyunca gözlenir. Bu zon daha önce, Menderes Masifi'nin düşük dereceli metamorfik birimleri olarak tanımlanmış (Akdeniz ve Konak, 1979; Işık ve Tekeli, 2001), daha sonra yeşil şist fasiyesi metamorfizması sonucu oluşmuş kaya gruplarından yapılı olan Afyon Zonu olarak adlandırılmıştır (Okay, 1984; Okay vd., 1996). Candan vd., (2005) tarafından bu zonun orta bölümünde yüksek basınç metamorfizması sonucu oluşmuş kayaçların varlığı da ortaya konmuştur. Afyon Zonu, Okay, (1984) tarafından Paleozoyik-Mesozoyik yaşlı platform tipi çökelleri olarak tanımlanır. Menderes Masifinin kuzeyinden Bolkardağ bölgesine kadar geniş bir alana yayılmıştır. Ofiyolitler ve Ovacık Birliği tektonik olarak Afyon Zonu üzerinde yer alır. Afyon Zonu'nun en alt seviyelerinde metakumtaşı ve metakuvarsitten oluşmuş, nadir metabazit ve mermer seviyeleri içeren, Sarıcasu Formasyonu olarak adlandırılan kalın bir istif yer alır. Metakırıntılılar üste doğru, Karbonifer-Üst Permiyen yaşlı koyu gri rekristalize kireçtaşlarına geçer (Erişen, 1972). Taban çakıltaşı ile başlayan Triyas istifi rekristalize algli kireçtaşlarından oluşur (Akdeniz ve Konak, 1979). Mesozoyik'in geri kalan kısmı Maastrihtiyen'e kadar uzanan ve Budağan kireçtaşı olarak adlandırılan, kalın platform karbonatlarıyla temsil edilir. Bu platform karbonatları üzerinde çeşitli kireçtaşı, radyolarit, ofiyolit, mavişist blokları kapsayan Üst Maastrihtiyen-Paleosen yaşlı bir blok bulunur (Akdeniz ve Konak 1979; Özcan vd.,1984). Bu blok, ofiyolit ve mavişist biriminin Afyon Zonu üzerine yerleştiğini gösterir. Afyon Zonu düşük yeşilşist fasiyesinde bölgesel metamorfizma geçirmiştir. Metamorfizmanın şiddeti alttan üste doğru azalır.

Harita ifadesinde KD-GB uzanımlı bir görüntü sergileyen *Menderes Masifi*, güneyde Likya napları, batıda İzmir - Ankara Zonu ve Kiklad Çekirdek Kompleksi, kuzeyde ise Afyon Zonu'na ait düşük dereceli metamorfik kayaçlar tarafından tektonik olarak üzerlenmektedir (Şekil 2.2). Masif ana hatlarıyla D-B uzanımlı normal fay sistemleri

tarafından; Demirci-Gördes astmasifi (kuzey asmasif), Ödemiş-Kiraz asmasifi (orta astmasif) ve Çine astmasifi (güney astmasif) olmak üzere üç ana bölüme ayrılmaktadır (Candan vd., 2011). Stratigrafik olarak Menderes Masifi'nin Prekambriyen yaşlı bir 'çekirdek' ve onu çevreleyen, Paleozoyik-Erken Tersiyer yaşlı 'örtü' serilerinden yapılı sade ve düzenli bir stratigrafiye sahip olduğu görüşü araştırıcılar arasında uzun yıllardan beri yaygın kabul görmüştür (Schuiling, 1962). Bunun yanında son çalışmalar, Geç Alpin yaşlı sıkışma tektoniği ürünü bindirme faylarının Masif'in bu ilksel stratigrafisini çok büyük oranda yeniden şekillendirdiğini net olarak ortaya koymuştur (Konak vd., 1994; Ring vd., 1999; Lips vd., 2001). Günümüzde çekirdek ve örtü serileri arasındaki ilksel dokanak ilişkisini simgeleyen Pan-Afrikan uyumsuzluğu (Şengör vd., 1984; Konak vd., 1987; Candan vd., 2011) çok ender bölgelerde gözlenebilmektedir. Çoğu yerde bu üniteler arasındaki dokanak ilişkisi bindirme faylarıyla tanımlanmaktadır. Bu tektonik ünitelerin iç stratigrafilerinin belirlenmesi ve birbirleriyle denkleştirilmesi sonucu günümüzde çekirdek ve örtü serilerinin stratigrafileri büyük oranda açıklığa kavuşturulmuştur (Konak vd., 1987; Dora vd., 2001, 2005). Menderes Masifi'ndeki Prekambriyen temelin Pan-Afrikan Orojenezi ile ilişkili, granulit, eklojit ve amfibolit fasiyesi koşullarında, çok evreli metamorfizmadan etkilendiğini göstermektedir (Candan & Dora, 1998; Candan vd., 2007). Örtü serilerinde ise yaygın Barrow türü orta-basınç metamorfizması topluluklarının yanı sıra yüksek-basınç/düşük-sıcaklık metamorfizması koşullarını tanımlayan yeni veriler elde edilmiştir (Rimmelé vd., 2002, 2003).

Ofiyolitler Pontidleri ve Anatolidleri birbirinden ayıran Tetis Okyanusu'nun kalıntıları büyük kütleler halinde İzmir-Ankara-Erzincan kenet süturunun güneyinde yer alır (Şekil 2.1 ve 2.2). Kuzeybatı Anadolu'da bulunan ofiyolitlerin büyük bir bölümü harzburjit ve dünit tipi peridotitlerden oluşur. Gabro, ofiyolit kütlelerin ufak bir bölümünü oluşturur. Yanal devamlılığı olmayan seyrek mikrogabro daykları peridotitleri keser. Mikrogabro daykları iri taneli olmalı ve seyrek bulunmaları ile tipik ofiyolitlerde görülen levha dayk komplekslerinden farklıdır. Gabroların piroksen, olivin, plajiyoklastan ve daykların albit, hornblend, pumpellitten oluşan minerolojik bileşimleri, ofiyolitlerin yüksek basınç düşük sıcaklık metamorfizması geçirmediğini gösterir.

Balıkesir' in kuzeyinde ve Kepsut' un kuzeydoğusundaki alanlarda geniş yüzlekler veren **İzmir–Ankara Zonu** kayaları, merceksel mikritik kireçtaşları içeren kumtaşı-şeyl ardalanmasından oluşan bir matriks ve bu matriks içerisindeki çeşitli boyulardaki blok konumlu rekristalize kireçtaşı, çört, serpantinit ve denizaltı volkanitlerinden oluşur. Yoğun bir deformasyona uğramış ve kıvrımlı-kırıklı bir yapı kazanmış olan birim inceleme alanının batı sınırı boyunca yüzlek verir. Yanal ve düşey olarak filiş fasiyesine ait karakteristik özellikleri yansıtan kırıntılı ve karbonat kayalardan oluşan matriks, aşırı derecede kıvrımlanarak deformasyon geçirmiştir. Tektonizma nedeniyle kaya birimlerinin ilksel katman yapıları bozulmuş ve yapısal süreksizlikler meydana gelmiştir. İzmir–Ankara Zonu' na ait kayaçlar, Oligosen yaşlı volkanitler ve daha genç yaştaki volkano-sedimanter birimler tarafından açısal uyumsuzlukla üzerlenir.

Oligosen yaşlı **volkanik birimler** Bingöl vd. (1973) ile Akyürek ve Soysal (1980) tarafından genellikle yeşil, gri ve kahverengi renkli, andezit, tüf ve aglomeralardan oluştuğu belirtilen birim, Ercan vd. (1984) tarafından andezit, dasit, tüf ve silisifiye tüfler olarak vurgulanır. Duru vd., (2012) çalışmasında ise volkanitleri yer yer alterasyona uğramış andezit, bazaltik andezitik lav ve bunların piroklastiklerden oluşan kayaçlar olarak tanımlanır. Krushensky (1976), Altunkaynak ve Genç (2008) ile Duru vd. (2012) tarafından yapılan radyometrik yaşlandırma çalışmalarında elde edilen 23.6–26.5 my yaş verileri volkanitlerin oluşumu ile lişkili volkanizmanın Oligosen' de etkin olduğunu göstermektedir. Birim Miyosen' de gelişen daha genç bir volkanizma ile kesilerek uyumsuzlukla üzerlenir.

HBFZ kuşağı içerisinde batıdan doğuya doğru Küçükdere, Eseler, İvrindi, Gökçeyazı, Turplu, Ovacık, Fethiye, Balıkesir ve Ayşebacı civarında olmak üzere en geniş alanı kaplayan Miyosen yaşlı **Volkano-sedimanter kayaçlar** genel olarak asidik bileşimli lavlar, dayklar ve bunlarla ilişkili olan piroklastik kayaçlar ile eş yaşlı gölsel çökellerden oluşur Krushensky (1976) ile Benda vd. (1974) tarafından 19.5–20.3 my olarak yaşlandırılmıştır.

Altunkaynak ve Genç (2008)'e göre, Miyosen volkanizması 2 faklı evre içerir. İlk evre erken Miyosen' deki granitik bir magmatizma ile bunun yüzeydeki eşleniklerini oluşturan bazaltik andezit, andezit, dasit ve trakiandezitlerden ibarettir ve Oligosen volkanizması üzerler niteliktedir. Kimyasal anlamda yüksek K ve şoşonitik bileşimi

ile ayrımlaşır. Bu evreden elde edilen radometrik yaşlar 18.5 ile 21.3 my arasında yoğunlaşır (Krushensky, 1976; Ercan vd., 1995 ve 1998; Aldanmaz vd., 2000; Altunkaynak ve Genç, 2008). Ortaç alkalin bileşime sahip trakiandezit ve andezitlerle simgelen ikinci evre volkanizma 15.3 ile 16.8 my arasında gelişmiştir (Altunkaynak ve Genç, 2008).

Biga Yarımadası'nda çok geniş alanlarda yüzlekler veren, Pliyo–Kuvaterner yaşlı **Bayramiç formasyonu** kendinden önce oluşmuş tüm birimler üzerinde uyumsuz olarak yer alır. Birim tabanda baskın olarak alüvyon yelpazesi ve örgülü akarsu ortamlarını yansıtan çakıltaşı, kumtaşlarından yapılıdır.

Holosen yaşlı **Alüvyal çökeller** güncel drenaj ağının ürünlerini oluşturur. Özellikle Havran, İvrindi, Gökçeyazı, Şamlı ve Karaman civarında geniş yüzlekler veren bu birim baskın olarak; alüvyon yelpazesi, alüvyon düzlüğü ve güncel dere çökellerinden yapılıdır.

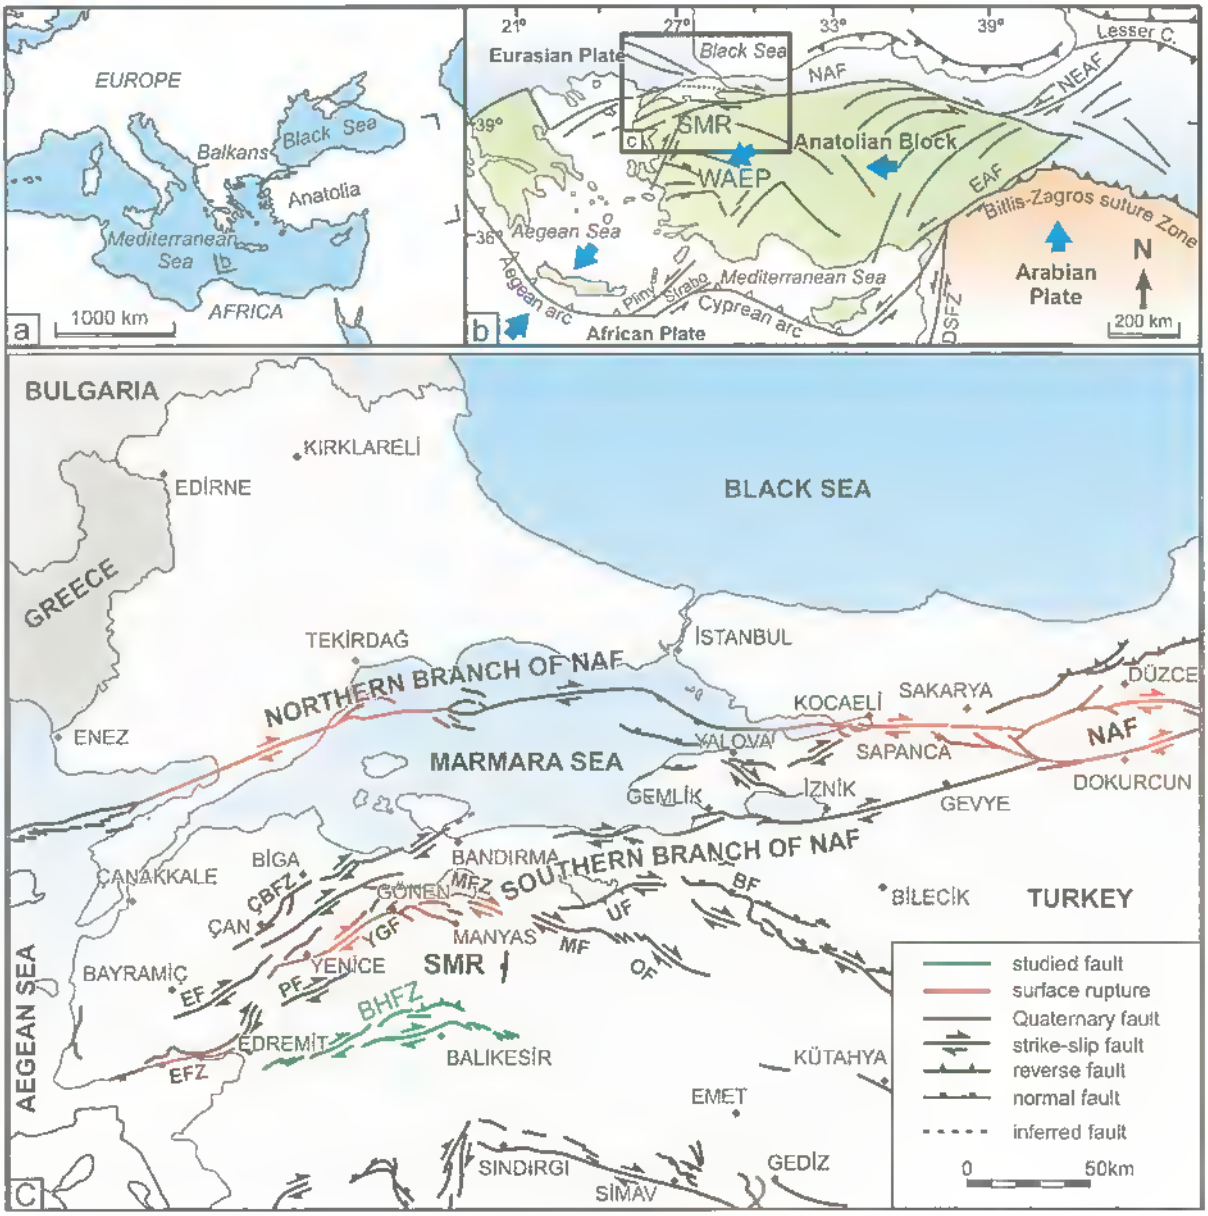
2.2. Aktif Tektonik

Çalışma alanınBalıkesir il sınırları içinde Kuzey Anadolu Fayı'nın güney koluna ait fay segmentleri (Yenice-Gönen Fayı, Edremit Fay Zonu) ve Edremit Fay Zonu ile Balıkesir il merkezinden geçen Havran-Balıkesir Fay zonu ve güneydeki Simav fayı önemli sismojenik zonlardır (Şekil 2.5). Marmara Bölgesinin en önemli yapısı olan KAF, tarihsel ve aletsel dönemdeki çok belirgin olan sismik aktivitesi ve önemli yerleşim alanları ile ilişkisi yüzünden dünyadaki kıtasal doğrultu atımlı fayların en çok çalışılanlarından biridir (McKenzie, 1972, 1978; Dewey ve Şengör, 1979; Şengör vd., 1985; Barka, 1992; Armijo vd., 2002; Şengör vd., 2004). En doğuda, üçlü eklem olarak adlandırılan ve yaklaşık olarak Karlıova civarında bulunan alandan başlayarak kuzeye doğru dış bükey bir geometriyle batıya ilerleyen KAF, Düzce civarında Marmara Denizi'nin suları altında devam eder. Tekirdağ açıklarından sonra Gelibolu'da son kez karaya çıkan fay zonu, bu kez kuzeybatıya doğru dış bükey bir geometri ile Ege Denizi' ni katederek Yunanistan topraklarına doğru son bulur (Armijo vd., 2002; Şengör vd., 2004). Harita ifadesine bakıldığında KAF Marmara Bölgesi' ne geldiğinde, yaklaşık Düzce civarlarında güneye doğru birkaç kola ayrılır (Şekil 3). Bu noktada literatürde farklı görüşler mevcuttur. Bazı

çalışmacılar KAF' nin bu noktada Kuzey kol ve Güney kol olmak üzere iki kola ayrıldığını, bunlardan kuzeydekinin Marmara Denizi boyunca ilerleyerek ana yapıyı oluşturduğunu, güneydeki kolun ise Yenice–Gönen, Evciler ve Edremit Fay Zonları boyunca Biga Yarımadasını şekillendirdiğini vurgular (Şengör vd., 2004).

KAF ile ilgili bazı çalışmalar ise Marmara Bölgesi' nde bu fay zonunun üç kol ile temsil edildiğini savunur. Bunlardan Kuzey kol, Mudurnu Vadisinden Marmara Denizinin doğusuna kadar uzanır ve Saroz Körfezi'ne girer. Orta kol ise Mudurnu Vadisi'nde Kuzey koldan güneye doğru ayrılarak İznik Gölü' ne doğru ilerler. Güney kol ise Pamukova civarındaki KD-GB doğrultusulu bir fay parçası ile başlar (Koçyiğit, 1988) ve Yenişehir, Bursa ve Ulubat Fayları boyunca güneybatıya doğru ilerler. Bu alanda tarihsel dönemde birçok sismik aktiviteye sebep olduğu bilinen bu kol, güneye doğru Yenice – Gönen ve Edremit Fay Zonları ve meydana gelen 1944-Edremit (Ms=6.8) ile 1953-Gönen (Ms=7.2) depremleri ile simgelenir. Bu anlamda, raporun konusunu oluşturan faylar olan HBFZ ve EFZ, bölgesel tektonikte KAF ile birinci derecede ilişkili yapılar olarak öne çıkmaktadır (Şekil 2.5). Özalp vd. (2013) ise kuzey ve güney olarak ana kollara ayırdıkları fay zonunun, güney kolunun birbirlerinden sağa sıçramalı parçalardan oluşmuş bir geometriyle Biga içine ilerlediğini belirtirler.

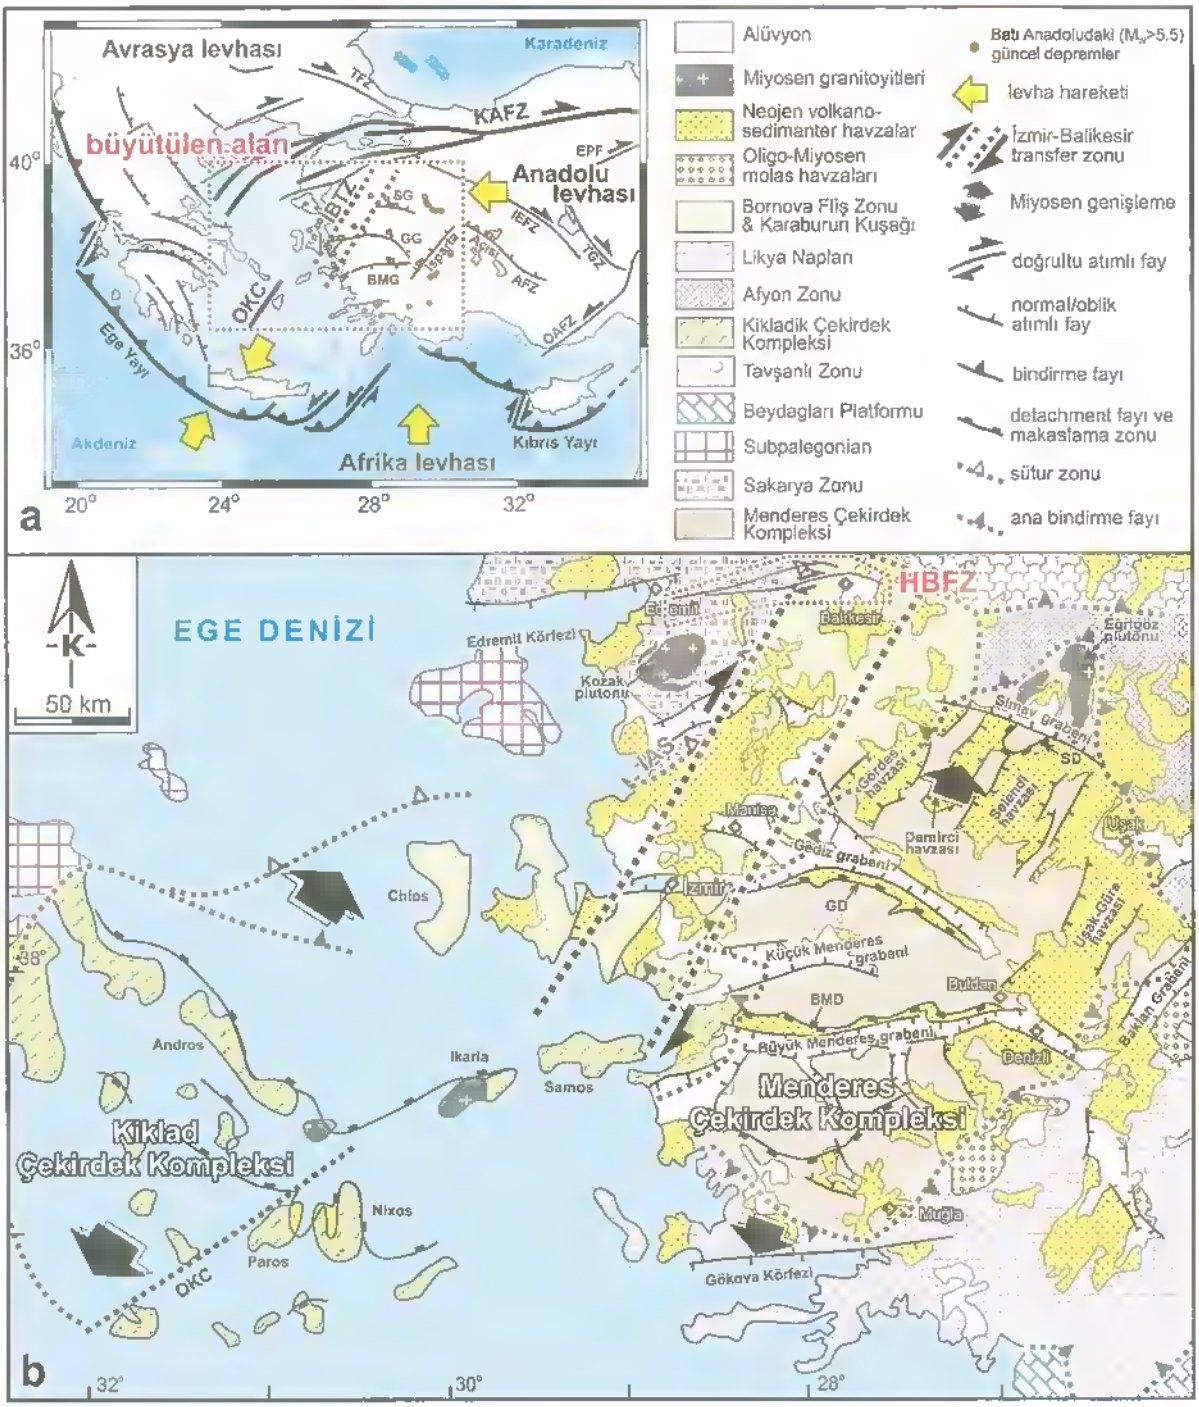
Literatürde Biga içine doğru ilerleyen Emre ve Doğan, (2010) ve Emre vd., (2011)'de tanımlanan, yaklaşık B – D ve DKD – BGB uzanımlı Yenice – Gönen, Çan – Biga, Bekten, Pazarköy, Evciler, Havran – Balıkesir ve Edremit Fay Zonları, bölgesel tektonik anlamında KAF ile birinci derecede ilişkili yapılar olarak değerlendirilirler. Yapılan son çalışmalarda, Havran-Balıkesir fay Zonu (HBFZ)'nun da KAF sistemi içinde değerlendirilmesi gerektiği savunulmaktadır (Sözbilir vd. 2014; Sözbilir vd. 2016).



Şekil 2.5. (a) Çalışma alanının Doğu Akdeniz'deki yeri (Kaymakçı, 2006). (b) Türkiye'nin ana tektonik hatları (Kaymakcı, 2006 ve Özkaymak, 2015'den oluşturulmuştur). (c) Kuzeybatı Anadolu'nun basitleştirilmiş diri fay haritası (Emre & Doğan, 2010 Türkiye 1/250000 ölçekli diri fay haritaları serisi Ayvalık NJ 35-2 paftası kitapçığından değiştirilerek). Bursa Fayı (BF), Ulubat Fayı (UF), Mustafakemalpaşa Fayı (MF), Orhangazi Fayı (OF), Manyas Fay Zonu (MFZ), Yenice–Gönen Fayı (YGF), Çan-Biga Fayı Zonu (ÇBFZ), Evciler Fayı (EF), Pazarköy Fayı (PF), Edremit Fayı Zonu (EFZ), and the Havran-Balıkesir Fayı Zonu (HBFZ)

Çalışma alanının güneyinde ise, bölgedeki önemli yapılardan biri olan İzmir–Balıkesir Transfer Zonu (İBTZ), yaklaşık D–B uzanımlı Gediz (Alaşehir), Küçük Menderes ve Büyük Menderes grabenlerini, Menderes metamorfik çekirdek kompleksini ve bunlarla ilişkili olarak gelişen sıyrılma (detachment) faylarını batıdan sınırladığı görülür (Şekil 2.6; Sözbilir vd., 2011; Uzel vd., 2013). İzmir ile Balıkesir arasında KD-GB doğrultusunda uzanan İBTZ yaklaşık 150 km uzunluğundadır (Sözbilir vd., 2003; Sözbilir vd., 2011; Uzel vd., 2013). Yapılan son çalışmalar, Batı Anadolu kabuğu altında dalan Afrika Levhası'nın yırtıldığını ve bu yırtılmanın yüzeye doğru Batı Anadolu kabuğunda İBTZ'nin gelişmesine neden olduğunu göstermektedir (Gessner ve diğ., 2013, Uzel ve diğ. 2015). Buna göre, İBTZ dalan Afrika Levhası'ndaki yırtılmanın yüzeydeki izine karşılık gelmektedir. Bu nedenle yüzeydeki parçalanma İzmir (Gümüldür) ile Balıkesir (Bigadiç) arasında normal faylar da içeren doğrultu atımlı faylarca baskın bir zonun gelişimini sonuçlamıştır (Sözbilir ve diğ. 2003, Uzel ve Sözbilir, 2008, Sözbilir ve diğ. 2011, Özkaymak ve diğ. 2013, Uzel ve diğ. 2012, 2013, 2015). HBFZ bu kıtasal yırtılmanın karada takip edilebildiği en kuzey sınırında konumlanır ve bu yapıya yaklaşık 50° açı ile KKD–GGB doğrultusunda kuzeye doğru dışbükey bir geometriyle uzanır (Şekil 2.6).

Yukarıdaki tüm bu verilere göre, Ruhsat sahasının ve çevresi Kuzey Anadolu Fayı'na bağlı Yenice-Gönen Fayı ve Havran-Balıkesir Fayı etkisinde olduğu kabul edilebilir.

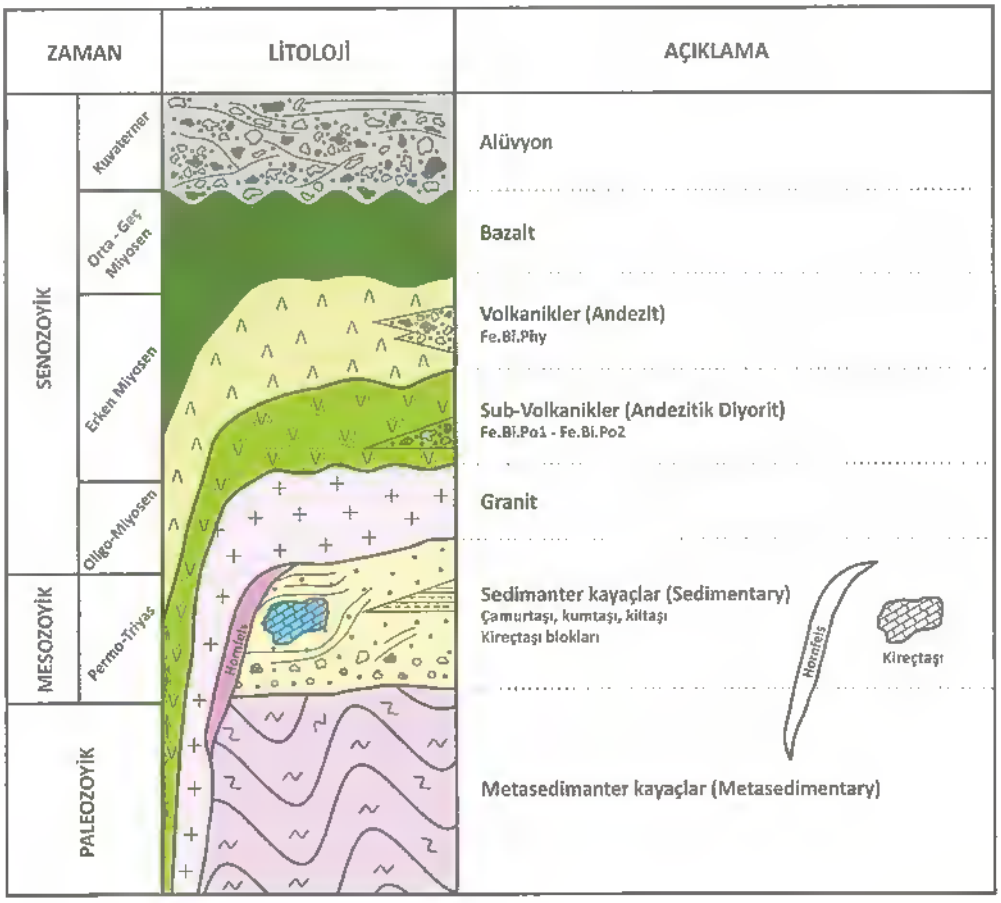


Şekil 2.6. Edremit ile Balıkesir arasında kalan alanın diri fay haritası ve Havran–Balıkesir Fay Zonu' nun bu alan içerisindeki geometrisi ve konumu (Emre vd., 2011).

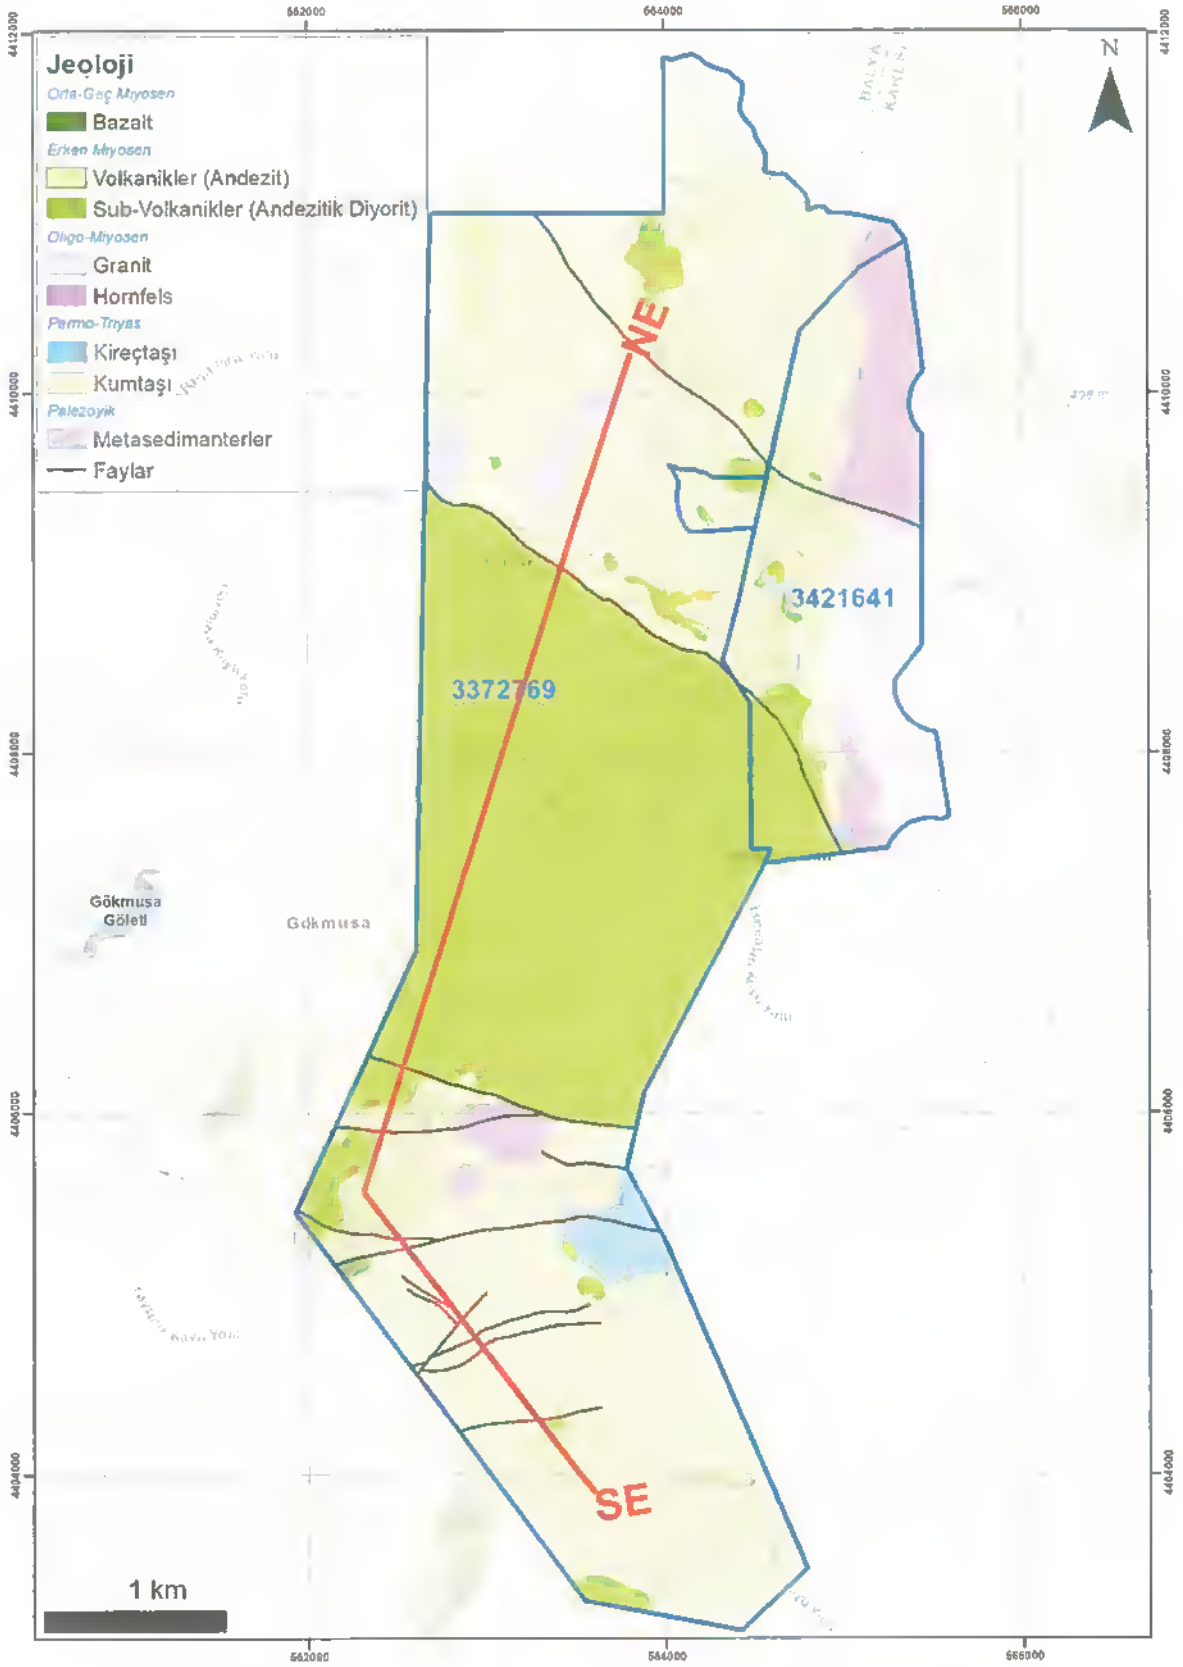
3. PROJE ALANI VE ÇEVRESİNİN JEOLOJİSİ

Çalışma alanı tabanında Karakaya Kompleksi'ne ait Alt Triyas yaşlı (Akyürek ve Soysal, 1989) ardalanmalı metakumtaşı-metaçakıltaşı ve metaçamurtaşından oluşan metamorfik/metasedimanter (MSed) seri yer almaktadır. Kıvrımlı olarak gözlenen bu seri, Alt-Orta Triyas yaşlı (Akyüz, ve Okay, 1998) çamurtaşı klastları içeren kumtaşı-kuvars kumtaşı (Ssa) - çamurtaşı (Sms) ve çakıltaşından (Scs) oluşan klastik seri tarafından uyumsuzlukla örtülmektedir (Şekil 3.1).

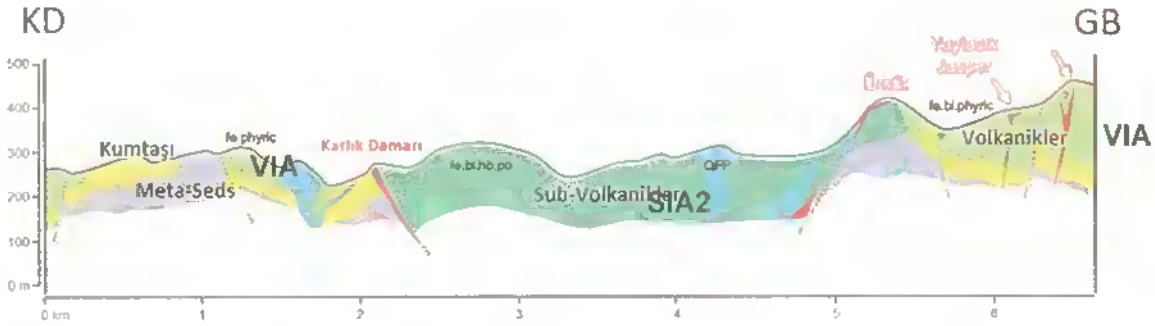
Oligo-Miyosen yaşlı (Koç vd., 1994; Duru vd., 2004) otobreş ve akma bantları gözlenen feldspar + biotit ± kuvars feldspar phyric asidik dasit-andezitik volkanikler (VIA-1/VIA-2), metasedimanter ve klastik serileri uyumsuzlukla üzerler ve tüm birimler Oligo-Miyosen yaşlı (Koç vd., 1994; Duru vd., 2004) ortaç/felsik nitelikli multifaz feldspar - biotit ± hornblend (SIA1) ve kuvars – feldspar porfiriden (QFP) oluşan subvolkanikler tarafından kesilir (Şekil 3.1, 3.2 ve 3.3).



Şekil 3.1. Çalışma alanına ait enine jeolojik kesit ve teorik kolon kesit (Altınordu Madencilik)



Şekil 3.2. Çalışma alanına ait jeoloji haritası (Altınordu Madencilik)



Şekil 3.3. Çalışma alanında KD-GB doğrultusu boyunca geçen enie jeolojik kesit (Altınordu Madencilik)

Çalışma alanı içerisinde subvolkanikler ile sedimanter ve volkanik birimlerin kontağında DB ve K60-70B doğrultulu yaklaşık 70 ~ 80 derece güney/güneybatıya eğimli faylar ile bu fay zonunu kullanan sonradan yerleşmiş multifaz epitermal kuvars damarları ve tüm bunları kesen KG ve KKD doğrultulu yanal atımlı atımlı faylar mevcuttur (Şekil 3.4).

Şekil 3.4. Cevherli kuvars damarı ve damar üzerinde gelişmiş olan faylanmaya ait izlerin arazi görüntüsü

4. İNCELEME ALANININ SİSMOTEKTONİĞİ: TARİHSEL VE ALETSEL DEPREM KAYITLARI

Çalışma alanının içinde bulunduğu Güney Marmara Bölgesi, gerek nüfus yoğunluğu gerekse sanayi alanlarının dağılımı göz önünde bulundurulduğunda Türkiye'nin en önemli bölgelerinin başında gelir. Dünyanın en aktif faylarından birisi olan Kuzey Anadolu Fayı'nın bölgedeki varlığı, Marmara ve güneyini deprem aktivitesi bakımından dünyada en çok araştırılan ve bilinen alanlardan biri haline getirmiştir. Antik çağlardan beri bölgede yerleşim alanları olması ve bu kentlerde yaşanan depremlerin kayıt altına alınarak arşivlenmesi de tarihsel deprem kataloglarının oluşturulmasına büyük ölçüde katkıda bulunmuştur. Depremselliği açısından değerlendirildiğinde Marmara bölgesi, Anadolu'nun diğer kalan kısmından farklı bir sismik karakter göstermektedir (Crampin & Evans, 1986). Bu çalışmacılar, bu farklı sismik özelliği nedeniyle bölgeyi ayrı bir tektonik ünite olarak Marmara bloğu şeklinde tanımlarlar. Eyidogan & Jackson (1985) ve Eyidoğan (1988) birleşmiş iç merkez tekniğinden yararlanarak yaptıkları çalışmalarda, bölgede gelişen depremlerin 10 – 15 km'den daha derin olmadığına işaret ederler. Marmara bölgesinde 1900-2025 yılları arası 4 ≤ M büyüklüğüne sahip 1000'in üzerinde deprem meydana geldiği belirlenmiştir. İstatiksel olarak son yüzyılda 15 büyük deprem meydana getirmiş olan KAF'ın dünyanın en aktif fayı olduğu bilinmektedir. Bu depremlerin karadaki toplam yüzey yırtılmasının 1100 km'ye ulaştığı belirtilmektedir (Özalp vd., 2013). Bu 15 depremden 7 ≤ M büyüklüğüne sahip, 1999 Düzce ve 2014 Gökçeada depremleri de dahil 6'sı Marmara bölgesinde uzanan parçalarda meydana gelmiştir. Bunun yanında, 1953 Yenice-Gönen depremi de güney kolda en son gerçekleşmiş olan 6 depremden en önemlisi olarak bilinir. Şekil 4.1'de bölgede aletsel dönem içerisinde meydana gelmiş 4 ve üzeri büyüklüğe sahip olan depremlerden, 15 adet farklı katalog çalışması ve sismoloji merkezlerinden elde edilen veriler birleştirilmiş ve çözümü olan deprem de şekil üzerine aktarılmıştır. Ters çözümler, bölgenin genel anlamda doğrultu atımlı bir deformasyon sonucunda şekillendiğini gösterse de özellikle kuzey kolda ve

bölgenin güneyinde normal faylanma mekanizmasının az da olsa güney kol üzerinde ters bileşenli deprem çözümlerinin de varlığı görülmektedir.

Tarihsel deprem kayıtlarına bakıldığında, Ambraseys & Finkel (1991), MS 1 ile MS 1899 arasında bölgede toplamda 600 civarında olay gerçekleştiğini fakat bunların 38'inin büyüklüğünün 7.0'den fazla olduğunu ve bölgeyi etkilediğini belirtmektedir. Bu çalışma kapsamında Ambraseys & Finkel (1991), Ambraseys (2002), Shebalin vd., (1974) ve Pınar & Lahn (1952) gibi çalışmalar taranarak büyüklüğü $6.8 \leq M$ olan 59 tarihsel olay belirlenerek, bu depremlerin yaklaşık belirtilen dış merkezleri Şekil 4.1 üzerine aktarılmıştır. Tarihsel ve aletsel deprem kayıtlarının yaklaşık dağılımına bakıldığında kuzey kolun aktivitesinin en yüksek olduğu görülmektedir. Orta koldaki deprem dağılımları ise en son depremlerin 1509 ve 1766 yılında gerçekleştiğini, 200–250 yıllık dönüş periyotları olduğu düşünüldüğünde bu alanın bir sismik boşluk olarak değerlendirilmesi gerektiği görülmektedir (Ambraseys, 2002). Bohnhoff vd., (2013) aynı zamanda bu boşluğun doğu ucundaki mikro depremleri değerlendirdiği çalışmasında, 30 km uzunluğunda ve 10 km derinliğindeki bir asismik zonun varlığını tanımlar. Aynı alanda Ergintav vd., (2014) 20 yıllık GPS verilerini değerlendirmiş ve diğer kolların hızlarına göre buradaki hızların çok daha yavaş geliştiğini belirlemiştir.

2000 yıllık deprem kayıtları değerlendirildiğinde KAF üzerindeki deprem tekrarlama periyotlarının benzer olduğu dikkat çekicidir (Ambraseys, 1988, 2002; Ambraseys & Finkel, 1991; Şengör vd., 2005). KAF'ın kuzey kolundaki paleosismolojik çalışmalar ise yüzey yırtılmasıyla gerçekleşen depremlerin dönüş periyotlarının 150–300 yıl arasında olduğunu göstermektedir (İkeda vd., 1991; Rockwell vd., 2001 ve 2009; Hartleb vd., 2003 ve 2006; Kozacı vd., 2009 ve 2011; Özaksoy vd., 2010). Güney kolda ise az sayıda paleosismolojik çalışma bulunmasına karşın. Özalp vd. (2013) en az kuzey kolda gelişmiş depremlerin büyüklüklerine yakın depremlerin güney kolda da gerçekleşmiş olması gerektiğini bildirmektedir. Buna göre, Güney Marmara bölgesinin de sismik risk bakımından detaylı bir şekilde araştırılması gereği ortaya çıkmaktadır. Bu nedenle yukarıda bahsedilen 3 ana fay çevresinde gelişen tarihsel ve aletsel deprem kayıtları ayrı başlıklar halinde verilecektir.

Şekil 4.1. Marmara Denizi ve Güneyinin sismotektonik haritası. Neotektonik döneme ait yapısal veriler Maden Tetkik Arama Müdürlüğü, Türkiye Diri Fay Haritaları Serisi (Emre, 2010; Emre & Doğan, 2010; Emre, Duman, & Özalp, 2011a, b ve c) birleştirilerek alınmıştır. Marmara Denizin'deki aktif faylar Le Pichon vd., 2001; Armijo vd., 2002; Cormier vd., 2006'dan yararlanılarak oluşturulmuştur. Aletsel depremlerin büyüklük ve dış merkez lokasyonları ISC (International Seismological Centre), USGS-NEIC (United States Geological Survey National Earthquake Information Center), KOERI (Boğaziçi University Kandilli Observatory and Earthquake Research Institute) ve Tan vd., 2008'den alınmıştır. Bölgeyi etkileyen tarihsel depremlerin (6.8 ≤ M) yaklaşık lokasyonları Ambraseys & Finkel, 1991, Ambraseys, 2002, Shebalin vd., 1974 ve Pınar & Lahn, 1952'den birleştirilerek oluşturulmuştur. Odak Mekanizma çözümü olan depremler ise (1) Canıtez & Toksöz, 1971, (2) McKenzie, 1972, (3) Euro-Med Seismological Centre (EMSC), (4) McKenzie, 1978, (5) United States Geological Survey National Earthquake Information Center (USGS-NEIC), (6) Harvard Centroid-Moment Tensor Project CMT (HRV), (7) Kalafat, 1989, (8) Kalafat, 1998, (9) Taymaz, 1999, (10) Tibi vd., 2001, (11) Tan & Taymaz, 2004, (12) Kalafat vd., 2009, (13) KOERI, (14) Altınok vd., 2012a (15) Republic of Turkey Prime Ministry Disaster & Emergency Managment Presidency-Earthquake Research Department (AFAD-ERD)'den alınmıştır. Çözümlere ait topların renkleri sırasıyla kırmızı, ters faylanmayı, mavi normal faylanmayı, siyah ise doğrultu atımlı faylanma mekanizmasını göstermektedir.

4.1 Edremit Fay Zonu (EFZ) ve Çevresinin Sismotektoniği

Bu bölümde EFZ ve çevresinde belirlenen alan içerisinde meydana gelmiş olan depremler, tarihsel ve aletsel dönem depremleri şeklinde iki ana başlık altında ele alınacaktır. Biga ve çevresine ait tarihsel dönem depremleri incelenirken, önceki yıllarda hazırlanan rapor, katalog ve derlemelerden yararlanılarak tüm deprem kayıtları taranmış ve tespit edilen deprem kayıtlarından 5 ve üzeri şiddetteki depremler değerlendirilmeye alınmıştır. Belirlenen 38 deprem için önerilen lokasyon sayısı 25'tir. Öngörülen lokasyonların coğrafik konumlarının göz önüne alındığında depremlerin daha çok EFZ ve Midilli Adası ve çevresinde dağılım gösterdiği görülmüştür (Şekil 4.2).

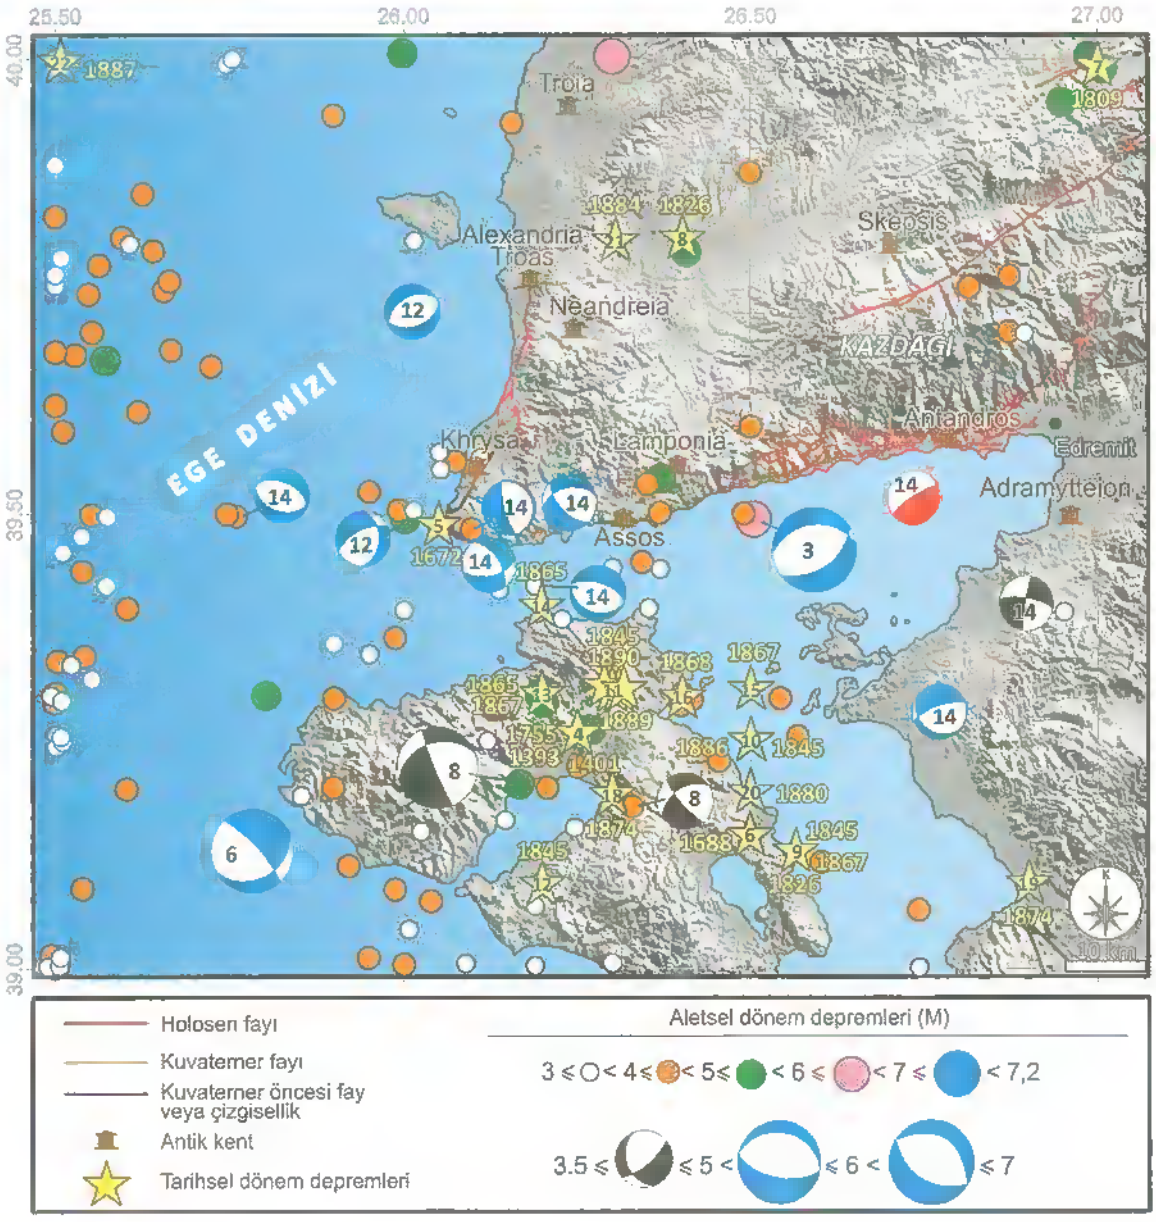
Tarihsel Dönem Deprem Etkinliği

Yapılan katolog taraması çalışmalarında, EFZ ve çevresinde meydana gelen tarihsel dönem depremleri M.S 160 ile MS 1898 yılları arasında meydana gelen 30 depremle temsil edilir. Bu depremlerden bazıları için çalışmalarda benzer lokasyonlar önerildiği görülmüştür. Belirlenen 30 deprem için önerilen lokasyon sayısı 18'dir. Öngörülen lokasyonların coğrafik konumlarının dağılımları Şekil 6'te verilmiş olup, bu lokasyonlarda meydana gelen depremlerin kataloglardaki özellikleri ve hangi kaynaklardan yararlanılarak verilerin elde edildiği ise ayrıntılarıyla Tablo 4.1' de sunulmuştur.

Kataloglarda bu depremlerden 3 tanesinin ön plana çıktığı görülmektedir. Bunlar kronolojik sırayla 14 Şubat 1672, 11 Ekim 1845 ve 7 Mart 1867 depremleridir. Ambraseys (2002) 1672 depreminin dış merkezinin Biga yarımadasının en güneybatı ucunda olması gerektiğini belirtir. Bu depremle ilgili en ayrıntılı bilgi Ambraseys & Finkel (2006) tarafından verilmektedir. Yazarlar değişik kaynaklardan topladıkları bilgileri şöyle özetlemektedir; "Bozcaada'da hemen hemen bütün evler yıkıldı, Venediklilerin kalesi ve kilisesi yıkıldı, İstanköy Adası'nda sarsıntının şiddeti nedeniyle ayakta kimse duramamış, bütün binalar çökmüş ve sarsıntının ardından bir deprem dalgası gelmişti". Deprem nedeniyle Truva'nın yakınındaki Ligya'da su pınarlarının kuruduğu söylenmektedir. Çalışmacılar bu son etkilerle beraber aynı depremin sonucunda olduğunu düşünerek depremin merkez üssünün Biga ilçesinin yakın kıyısı olması gerektiği sonucuna varmaktadırlar. 11 Ekim 1845 depremi, Shebalin vd. (1974) (I0 = X) tarafından yapılan çalışmaya göre Edremit Körfez'inde gerçekleşmiş ve yaklaşık 320 km bir çapta bir alanı etkilemiştir. Aynı deprem için Papazachos & Papazachou (1997), Midilli adasının etkilendiğini ve adada hasar yarattığından bahsetmektedir. Bölgede gerçekleşmiş diğer bir önemli deprem ise 7 Mart 1867 depremidir. Deprem değişik çalışmalarda farklı büyüklük ve şiddetlerle tanımlanır (Mw = 7.0, Soloviev vd., 2000; IO = X, Shebalin vd., 1974; M = 7.0, Comninakis & Papazachos, 1982). Bu depremin de tahmini lokasyonu değişik çalışmalarda Midilli Adası yakını olarak önerilir. Altınok vd. (2012a) bütün bu bilgilerin ışığında depremin Edremit Körfezi içinde gerçekleşmiş olması gerektiğini ve bir tusunamiye neden olduğunu savunurlar.

Aletsel Dönem Deprem Etkinliği

Elde edilen verilere göre aletsel dönem içinde Biga Yarımadası ve çevresinde, 3.0–4.0 aralığında 84 deprem, 4.0–5.0 aralığında 114 deprem, 5.0–6.0 aralığında 30 deprem, 6.0–7.0 aralığında 4 deprem ve 7.0 - 7.5 aralığında ise 3 olmak üzere toplam 232 deprem meydana gelmiştir. Diğer yandan EFZ ve çevresinde aletsel dönem içerisinde büyüklüğü 3.5 ve üzeri toplamda 19 deprem meydana gelmiştir. Bu depremlerden 2 tanesi 5–6 büyüklüğü arasındadır (Şekil 4.2, Tablo 4.1). Aletsel dönem içerisinde EFZ ile ilişkilendirilen en büyük deprem ise 6 Ekim 1944 depremidir (M: 6.7).



Şekil 4.2. EFZ çevresinin sismotektonik haritası. Neotektonik döneme ait yapısal veriler MTA, Türkiye Diri Fay Haritaları Serisi (Emre & Doğan, 2010; Emre, Doğan, & Özalp, 2011)'dan birleştirilmiştir. Aletsel dönem depremler ISC, USGS-NEIC, KOERI'den derlenmiştir. Bölgeyi etkileyen tarihsel dönem depremleri ise Salomon-Calvi, 1941; Pınar & Lahn, 1952; Ergin vd., 1967; Öcal, 1968; Shebalin vd., 1974; Soysal vd., 1981; Ambraseys & Jackson, 2000; Ambraseys, 2002; Ambraseys & Finkel, 2006'dan derlenmiştir.

6 Ekim 1944 tarihinde meydana gelen deprem (Zimmermann, 1945), Kazdağı'nın güneyinde en son etkili olan ve aletsel dönem içerisindeki en büyük depremdir (Ms = 6.8, Ambraseys, 1988; Mw = 6.7, EMSC). Saat 07:28' de Edremit Körfezi kuzeyinde meydana gelen bu deprem, Doyran yolu üzerinden başlayıp Küçükkuyu'dan Arıklı iskelesine doğru uzayan yüzey kırığı meydana getirmiştir (Yaltırak, 2006). Ambraseys & Jakson (2000) depremin büyüklüğünün 6.8 ve sismojenik zonun kalınlığı ve deprem büyüklüğü ilişkisi ile yüzey kırığının 37 km olması gerektiğini hesaplamışlardır. Bu depremle ilgili en ayrıntılı çalışmalar Altınok vd. (2012a ve 2012b)'dir. Çalışmalarda o tarihteki gazete ve mecmualardaki tüm bilgiler, görgü tanığı ifadeleri birleştirilerek, 1944 depreminin körfezin içinde gerçekleştiği ve tsunamiye sebep olduğuvurgulanmaktadır. Ayrıca çalışmacılar o dönemde tutulan kayıtlardan ve birçok kaynaktan topladıkları verileri birleştirerek 2200 taş evin yıkıldığını, 3100 evin ağır hasar gördüğünü, 275 yaralı olduğunu ve 73 kişinin hayatını kaybettiğini bildirirler.

Tablo 4.1. Biga Ve Çevresinde Gerçekleşmiş Tarihsel Dönem Depremleri Ve Bu Depremlerin Yaklaşık Lokasyonları, Etkiledikleri Alanlar ve Bu Kaynaklar. Kısaltmalar; I: Şiddet, M: Büyüklük. *Deprem Lokasyonları İçin Şekil 4.2'ye Bakınız.

4.2 Havran-Balıkesir Fay Zonu (HBFZ) ve Çevresinin Sismotektoniği

Bu bölümde Havran-Balıkesir Fay Zonu ve yakın çevresinde meydana gelmiş olan tarihsel ve aletsel dönem depremler harita ve tablo üzerinde verilerek olasılıkla bu fay zonu üzerinde gerçekleşmiş depremler ayrı ayrı irdelenecektir. Edremit–Balıkesir–Bergama alanı ve yakın çevresine ait tarihsel dönem depremleri incelenirken, önceki yıllarda hazırlanan rapor, katalog ve derlemelerden yararlanılarak tüm deprem kayıtları taranmış ve tespit edilen deprem kayıtlarından

5 ve üzeri şiddetteki depremler değerlendirilmeye alınmıştır. Yapılan değerlendirme sonucu proje alanı ve çevresinde M.S 160 ile MS 1898 yılları arasında meydana gelen 10 adet tarihsel, 22 adet aletsel dönem deprem tespit edilmiştir. Tarihsel dönem depremlerden bazıları için çalışmalarda benzer lokasyonlar önerildiği görüldüğünden belirlenen 10 deprem için önerilen lokasyon sayısı 9 olarak kayıtlara geçmiştir. Bölge için öngörülen/saptanan tüm önemli deprem lokasyonlarının coğrafik dağılımları Şekil 4.3' te verilmiş olup, tarihsel döneme ait lokasyonlarda meydana gelen depremlerin kataloglardaki özellikleri ve hangi kaynaklardan yararlanılarak elde edildiği ise Tablo 4.2'de sunulmuştur.

Tarihsel Dönem Depremleri

Tarihsel döneme ait deprem kayıtlarında Balıkesir ve yakın çevresini etkileyerek yıkıma sebebiyet vermiş 3 önemli deprem göze çarpar. Bu sarsıntılardan kronolojik olarak ilk deprem 21 Eylül 1577 depremidir. Ambraseys & Finkel (1995)' tarafından yapılan bir çalışmada bu depremin ayrıntıları aynı tarihte Balıkesir kadısına yazılan bir mektuptan yola çıkarak verilmektedir. Bu mektubun bir bölümünün çevirisi Erdoğan (1968) 'da şu şekilde verilmektedir; "Zelzele birçok evin yıkılmasına neden oldu, şehir merkezi ve köylerde insanlar öldü. Zağanos Paşa Camii'nin minberi, destekleri ve iki harim kubbesi ile beş avlu kubbesi tahrip oldu. Bu tahribat öylesine fazladır ki yeniden yapılması gerekiyor. Minarenin şerefesi ile mermer sütunlar koptuğu için, insanlar onarım işlemlerini yapamıyor. İmaretin ahırının bir tarafı tamamen çöktü ve türbesinin kubbesi çatladı. Yıldırım Han Camii harabeye döndü, minaresi çöktü tamirat için büyük masraf gerekiyor. Bazı mescitler ve muallim mektepleri çökerek kullanılmaz hale geldi. Kente ve köylerde 40 kişi hayatını kaybetti". Bu mektup açık bir biçimde yıkımın fazla olduğunu belirtirken, yıkımın daha çok şehir merkezinde yoğunlaşması da dikkat çekicidir.

Tablo 4.2. Balıkesir ve çevresinde gerçekleşmiş tarihsel dönem depremler, bu depremlerin yaklaşık lokasyonları, etkiledikleri başlıca alanlar ve kaynaklar Kısaltmalar; I: Şiddet, M: Büyüklük. *Deprem lokasyonları için Şekil 7'ya bakınız.

Şekil 4.3. Havran–Balıkesir Fay Zonu ve çevresinin sismotektonik haritası. Neotektonik döneme ait yapısal veriler Duru vd. (2012), 1/250.000 ölçekli Türkiye Diri Fay Haritası'nın Balıkesir NJ-35-3 paftası (Emre vd., 2011) ve bu çalışma kapsamında elde edilen saha verilerinden birleştirilmiştir. Aletsel dönem depremler ISC, USGS-NEIC, KOERI'den derlenmiştir. Odak Mekanizma çözümlerinin referans açıklamaları: (2) McKenzie (1972), (3) Euro-Med Seismological Centre (EMSC), (8) Kalafat (1998), (11) Tan ve Taymaz (2004), (12) Kalafat vd. (2009)' dan alınmıştır. Bölgeyi etkileyen tarihsel dönem depremler ise Salomon-Calvi (1941), Pınar ve Lahn (1952), Ergin vd. (1967), Öcal (1968), Shebalin vd. (1974), Soysal vd. (1981),

Ambraseys ve Jackson (2000), Ambraseys (2002) ile Ambraseys ve Finkel (2006)' dan derlenmiştir.

Şehir merkezini etkilemiş diğer önemli depremler ise 1897 ve 1898 depremleridir. Bu depremlerden 29 Ocak 1898 depremi ile ayrıntılı bilgi tarihsel kayıtlarda mevcuttur. Bu deprem Koca Zelzele olarak bilinir (Yazıcı, 2003). Ramazan ayının ilk haftasının Cumartesi günü meydana gelmiş olan depremin öncesinde 3–4 saat öncesinde meydana gelmiş küçük öncü depremler, halkı sokağa dökmüş ve böylelikle can kaybını azaltıcı bir etki sağlamıştır. Kent arşivinden 51 binanın orta ve ağır derecede hasar gördüğü belirlenmektedir (Yazıcı, 2003). Ölü sayısı hakkında her hangi bir sayısal veri olmamasına karşın yazar, sayının yıkıma göre azlığının öncü şoklara bağlı olduğunu ifade etmektedir.

Aletsel Dönem Depremleri

Elde edilen verilere göre devam eden aletsel dönem içerisinde HBFZ ve çevresindeki deprem aktivitesine bakıldığında büyüklüğü 5'ten büyük olan 22 adet deprem meydana geldiği görülmektedir. Bu depremlerden HBFZ'nun kuzeyinde konumlanmış olan Yenice–Gönen ve Manyas Depremleri ile güneyinde meydana gelmiş olan Bergama Depremi dışında herhangi birinin hasara veya can kaybına sebebiyet verdiği bilinmemektedir. 1964 yılında kayıtlara geçmiş olan Manyas Depremi Ms=6.2 büyüklüğündedir ve kırılan fay düzlemi 122°/54° konumludur (McKenzie, 1972). Bu düzlem boyunca gelişen kayma vektörünün yerçekimi yönünde olduğu ve yatay düzlemle 90° açı yaptığı hesaplanmıştır.

HBFZ boyunca kayıtlanan depremlerden sadece 29.09.2007 tarihli olanına ait deprem odak çözümü bulunmaktadır. Kalafat vd. (2009)' da verilen ters faylanmayı karakterize eden çözüm dikkat çekicidir. Özellikle HBFZ'nin en kuzeydeki bölümünü temsil eden Ovacık segmentine ait fay parçalarının araziden alınan ölçülere göre kinematik özellikleri ters bir faylanma türüne işaret eder. Emre vd. (2011)' de fayın bu bölümünün sıkışmalı bir büklüm geometrisine sahip bir ters faylanma mekanizmasına sahip olduğu belirtilmiştir. Bütün bu veriler değerlendirildiğinde, hem arazi verileri, hem fayın geometrisi, hem de fayın üzerine düşen depreme ait odak mekanizmasının karakteri HBFZ'nun en kuzey bölümünü oluşturan Ovacık segmentinin transpresyonel bir deformasyonla oluştuğunu göstermektedir. HBFZ ve çevresinde gelişen aletsel dönem depremlerinin azlığı ve sismolojik veri eksikliği

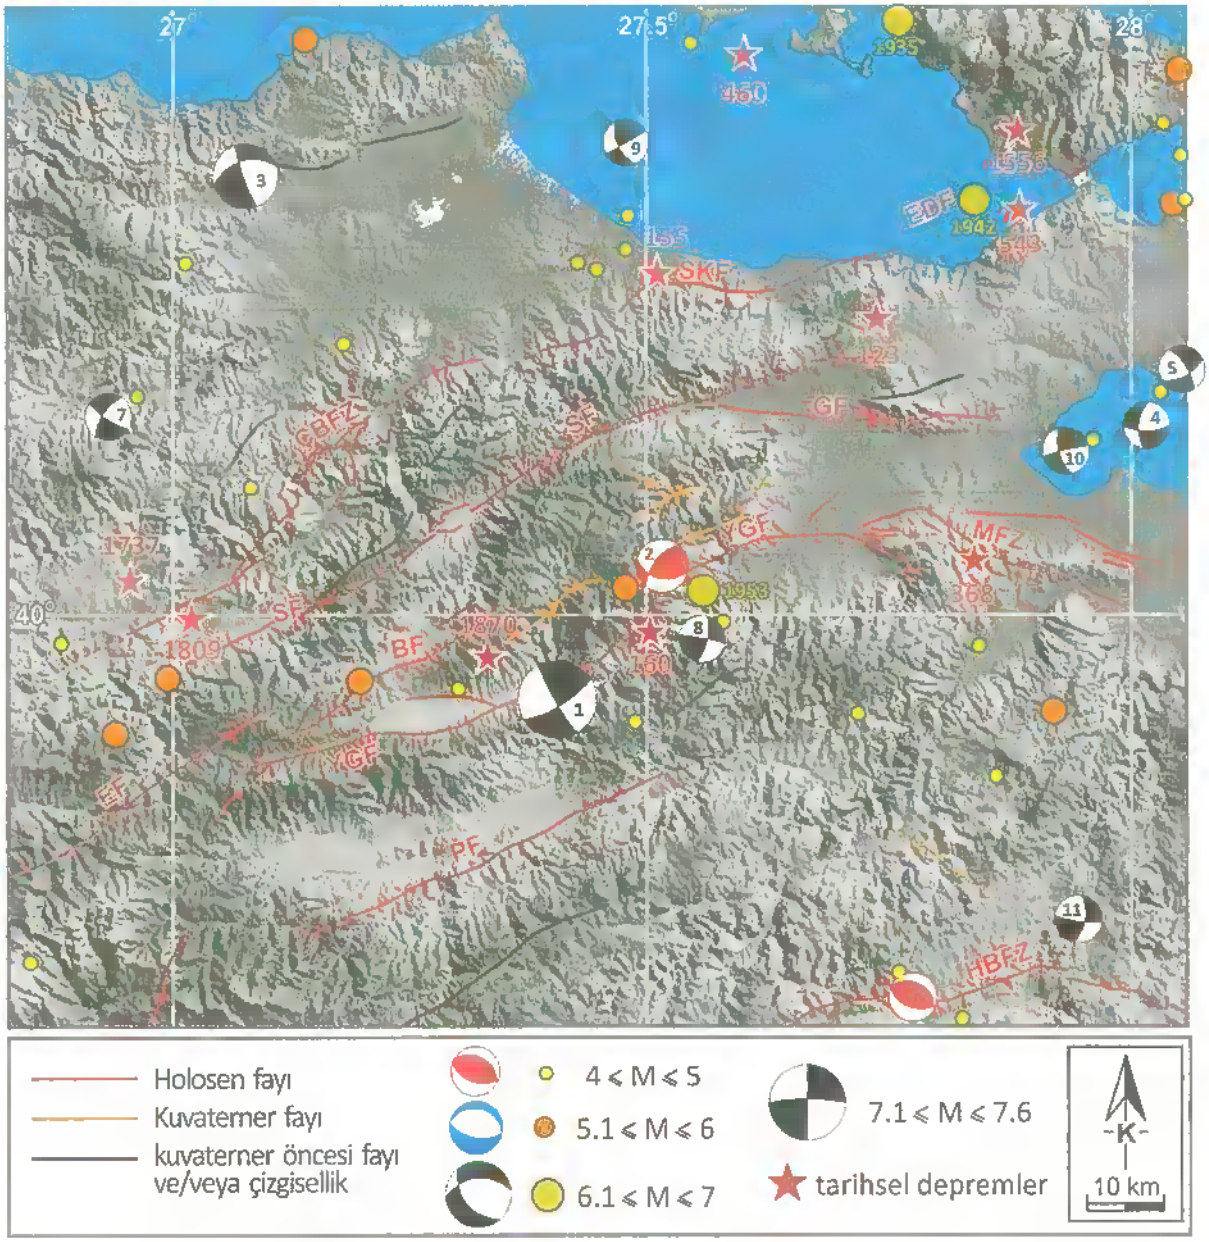
nedeniyle yorum yapmayı güçleştirmekle birlikte bu fay zonu boyunca biriken deformasyonun uzun süreden beri depolanmış olabileceğini de göstermektedir.

4.3 Yenice-Gönen Fayı ve Çevresinin Sismotektoniği

Yenice-Gönen Fayı merkez olarak kabul edildiğinde belirlenen tarihsel ve aletsel dönem depremlerinin odak mekanizma çözümü Şekil 4.4 üzerine düşürülerek sentezlenmiştir. Bu alanda meydana gelmiş olan tarihsel depremlerin listesi Tablo 4.3'de sunulmuştur.

Tarihsel dönem depremleri

Biga Yarımadası orta bölümü Yenice-Gönen Fayı ve çevresinin tarihsel dönem depremleri incelenirken, önceki yıllarda hazırlanan rapor, katalog ve derlemelerden yararlanılarak tüm deprem kayıtları taranmış ve tespit edilen deprem kayıtlarından 6 ve üzeri şiddetteki ve büyüklük cinsinden çevirimleri değişik çalışmalar tarafından yapılmış 6 ve üzeri büyüklükteki depremler değerlendirilmeye alınmıştır. Yapılan değerlendirme sonucu bahsi geçen bölgede MS 123 ile MS 1870 yılları arasında meydana gelen 10 depremin varlığı belirlenmiş bu depremlerden bazıları için değişik çalışmalarda farklı ve/veya benzer lokasyonlar önerildiği görülmüştür. Öngörülen lokasyonların coğrafik konumlarının dağılımları Şekil 8'de verilmiş olup bu lokasyonlarda meydana gelen depremlerin kataloglardaki özellikleri ve hangi kaynaklardan yararlanılarak bilgilerin elde edildiği ise Tablo 4.3'de sunulmuştur.



Şekil 4.4. Yenice-Gönen Fayı ve çevresinin sismotektonik haritası. Neotektonik döneme ait yapısal veriler Maden Tetkik Arama Müdürlüğü, Türkiye Diri Fay Haritaları Serisi, Emre vd. (2011a ve b)'den birleştirilmiştir. Diri fay kısaltmaları; SF: Sarıköy Fayı, PF: Pazarköy Fayı, YGF: Yenice Gönen Fayı, SKF: Sinekçi Fayı, ÇBFZ: Çan Biga Fay Zonu, EDF: Edincik Fayı, EF: Evciler Fayı, GF: Gündoğan Fayı, MFZ: Manyas Fay Zonu, BF: Bekten Fayı, HBFZ: Havran Balya Fay Zonu. Tarihsel dönem depremlerin ayrıntıları için Tablo4'e bakınız. Çözümlere ait topların renkleri sırasıyla kırmızı, ters faylanmayı, mavi normal faylanmayı, siyah ise doğrultu atımlı faylanma mekanizmasını göstermektedir.

Tablo 4.3. Yenice-Gönen Fayı Ve Çevresinde Meydana Gelmiş Tarihsel Depremlerin Listesi Ve Bu Depremlere Ait Açıklamalar. Kısaltmalar; I: Şiddet, M: Büyüklük. Deprem Lokasyonları İçin Şekil 8'e Bakınız.

REFERANSLAR (1) Ergin vd., 1967; (2) Ambraseys & Finikel, 1991; (3) Ambraseys & Jackson (2000); (4) Ambraseys, 2002; (5) Ambraseys, 2009, * koordinat ve depremin parametrelerinin alındığı referans						

Bu bilgiler ışığında, belirlenen depremlerin hemen hemen hepsinin Cyzicus (Erdek) Hellespont başkentinde yıkıma sebebiyet verdiği ve bu yıkımlarda, imparatorluğun yıkılan başkentlere ve büyük şehirlere parasal yardımda bulunduğu tarihsel kayıtlarda belirtilmektedir (Ambraseys, 2009). MS. 123 depremi, katologlarda en çok veri olan depremlerden biridir. Ambraseys & Finikel (1991), bu depremin, 10 Kasımda gerçekleştiğini ve Hellespont'un başkenti Cyzicus'un (Erdek) ve bu kente bağlı olan tüm yerleşimlerin bütünüyle yok olduğunu belirtir. Roma İmparatorluğu'nun kentlerin yeniden kurulmasına maddi destek verdiğini raporlar.

Ambraseys (2009) ise 123 depremiyle ilgili en çok bilgi veren çalışmadır. Bu çalışmada 123 depreminin Cyzicus'ta (Erdek) büyük yıkıma sebebiyet verdiği, 150 km batıdaki Nicaea'da etkili olduğu Marmara kıyılarının bütünüyle depremi hissettiğini, ayrıca başkentin 30 km batısındaki Baris'in de depremden zarar gördüğünü bildirmektedir. Çalışmacı, Ioannes Malalas'ın metinlerinden yola

çıkarak, Aelius Traianus Hadrianus'un talimatıyla, başkent Cyzicus'ta Agora ve tapınakların yeniden inşaası için kaynak ayırıldığını rapor etmektedir. 155 ve 160 depremleri tarihte sıklıkla karıştırılan iki depremdir. Etkiledikleri alanların dağılımları ve oluşum tarihlerinin birbirlerine yakınlığı dolayısıyla karıştırılan bu depremler, farklı kataloglarda değişik çalışmacılar tarafından aynı deprem olduğu ileri sürülmüş ise de, kaynaklar doğru tarandığında, bu iki depremin farklı depremler olduğu görülmektedir. 155 depreminin tam tarihi bilinmese de Ambraseys & Finikel (1991) Cyzicus (Erdek), Bithynia Hellespont başkentinin tamamen yıkıldığını, depremin Efes ve Symrna'da paniğe yol açmış olduğunu belirtir. Ambraseys (2009) ise depremin Lesvos'u (Midilli) merkez alarak anlatır.

Sözbilir vd. (2016) 155 ve 160 depremlerinin birbirlerine yakın aralıklarda olduğunu ve aynı 1944 (Edremit) ile 1953 (Yenice) depremlerine benzer şekilde tarih aralıklarına sahip olduklarını ve bu depremlerin bahsi geçen faylar üzerinde sırasıyla tetiklenme yoluyla oluşmuş olabileceklerini vurgular. Kasım 368 depremi ise Ambraseys & Finikel (1991)'de M.Kemalpaşa'nın büyük bir bölümünün yıkıldığı ve Hellespont'taki Nicaea ve Germa'da büyük artçı sarsıntılar meydana geldiğini şeklinde raporlanmaktadır. Ambraseys (2009) ise depremi Nicaea merkezli olarak verir. Çalışmacıya göre, deprem Nestorian'ın günlüklerinde şöyle aktarılmaktadır: "368'de batıdan doğuya çok büyük bir deprem oldu, birçok Roma kenti ve özellikle Nicaea tamamen yıkıldı. Persia'da da 3 köy harap oldu". 7 Nisan 460 depremi ise Ambraseys (2009)'da yine Cyzicus (Erdek) merkezli olarak verilir. Kantin tamamen yıkıldığı ve can kaybının büyük olduğu aktarılır. Bithynia ve Constantinople'de depremi takip eden ve büyük tahribat yaratan sağanak yağmurun meydana geldiğini belirtir. Ünlü Antakyalı tarihçi Ammianus Marcellinus'un aktardıklarına dayanarak, MS. 472'de Constantinople'de bir kül bulutu meydana geldiğini raporlar.

6 Eylül 543 depremi ise Ambraseys & Finikel (1991)'de "Cyzicus (Erdek) Hellespont başkentinin yarısı yıkıldı, deprem, Kostantinapolde'de zarara yol açtı" şeklinde verilmektedir. Ambraseys (2009) Ioannes Malalas'ın ve Pseudo-Dionysius'un metinlerinden yola çıkarak depremi yine Cyzicus (Erdek) merkezli olarak verir. 10 Mayıs 1556 depremi ise bütün Marmarayı etkilemiş olduğu bilinen en önemli depremlerden biridir. Bu depremi Ambraseys & Finikel (1991) Erdek yakını

Aydıncık'ta can kaybı, Bursa'dan İstanbul'a kadar hasar, Ayasofya ve Fatih camiinde hasar ve Gönen'de yıkım şeklinde tanımlar.

Ambraseys (2009)'da aynı depremin doğu Marmara'yı aşırı derecede etkilediği ve bir çok insanın hayatını kaybettiği bir olay olduğu tanımlanır. İstanbul'daki görgü tanıklarının ifadelerinde şu satırlara yer verilir; "Gece yarısı büyük bir sarsıntıyla uyandık, yatağımızdan doğrulamayacak kadar büyüktü, masalar, masanın üstündeki kitaplar, fincanlar, soba hepsi yuvarlandı". Ambraseys (2009) 1556 depreminin ardından yazılan bütün metinleri derleyerek, depremin Marmara Denizi içinde ya da güney kıyısında olması gerektiğini savunur. 6 Mart 1737 depreminde Ambraseys & Finikel (1991) Bozcada ağır hasar meydana geldiği depremin Chios'tan (Sakız) İstanbula kadar hissedildiğini bildirir. Ambraseys (2009) aynı depremi Biga merkezli olarak verir. Çalışmacı, konsolosluk raporlarınan yola çıkarak, Kilidulbahir, Seddülbahir, Sultanhisar (Çanakkale) ve Bozcaada kalelerinin çökmeye yakın bir hasara uğradığını, Bolayir, Ezine, Artaki ve Erdek'in komple yıkıldığını, Ezine, Tuzla, Bayramiç, Kale-i Sultanniye ve Bozcaada'ya bağlı bir çok kaza ve köyün yıkıldığını ve can kaybının yaşandığını bildirir. Çanakkale'de yerlerden sular çıktığı ve toprak kaymaları meydana geldiğini bildirir. Ayrıca diğer raporlardan yola çıkarak, Foglieri (Eski Foça) kalesinin bir bölümünün yıkıldığı, şok dalgalarının İzmir ve Sakız Adası"nda hissedildiğini ve az bir hasara sebebiyet verdiğini, artçı sarsıntıların Thessaloniki ve İstanbul'da da hissedildiğini vurgular.

07 Şubat 1809 ve 10 Eylül 1870 depremleri ise diğer depremlerden daha az hasara sebebiyet vermiş olan sarsıntılardır. Ambraseys & Finkel (1991) 1809 depremi için Dardanel'e kıyılarında yıkım, Bozcada karşısında ve İmroz ile Esk İstanbul'da hasar olduğunu ve Ege denizindeki gemiler ile İzmir körfezindekilerin şok dalgalarını hissettiğini bildirir. 1870 depremi ise Ergin vd. (1967)'de Çanakkale ve Gelibolu'da sallantılar olduğunu, Balıkesir ve İzmir'de de sallantının hissedildiğini vurgular. Ambraseys (2009) ise 1870 depreminin ana sarsıntısının Çanakkale ve Gelibolu'da hissedildiğini ve ortalama 5 saniye sürdüğünü belirtir.

Aletsel dönem depremleri

Elde edilen verilere göre devam eden aletsel dönem içinde Yenice-Gönen fayı merkez olacak şekilde seçilen alan içerisinde büyüklükleri 4.0 - 5.0 aralığında 24

deprem, 5.0 - 6.0 aralığında 8 deprem, 6.0 - 7.0 aralığında 3 deprem ve 7.0 - 7.5 aralığında ise 1 olmak üzere toplam 36 deprem meydana gelmiştir.

Aletsel dönem içinde bu alanda oluşan deprem aktivitesine bakıldığında, büyüklüğü 4 ile 5 arasında değişen 24 adet depremin herhangi birisinde hasara veya can kaybına sebebiyet verdiği rapor edilmemiştir. Bu depremlerden 4, 5, 6, 7, 8, 9 ve 11 no'lu 7 depremlerin odak mekanizma çözümü değişik araştırmacılardan elde edilerek belirlenmiştir (Tablo 4.5).

Tablo 4.5. Yenice-Gönen Fayı Ve Çevresinde Meydana Gelmiş Ve Odak Mekanizma Çözümü Üretilmiş Olan Aletsel Dönem Depremlerin Listesi Ve Bu Depremlere Ait Parametreler (DAF: Doğrultu Atımlı Faylanma, TF: Ters Faylanma). Kaynaklar: (1) Mckenzie, 1972; (2) Harvard; (3) KOERİ; (4) USGS; (5) Kalafat, 2009. Depremlerin Lokasyonları İçin Şekil 8'e Bakınız.

Diğer depremlerin dış merkez lokasyonları ise özellikle Manyas gölü ve çevresinde yoğunlaşırken, 8 numaralı 10/07/2008 tarihli 4.2 büyüklüğündeki depremin dış merkez lokasyonu Yenice Gönen Fayı yakınına bir alana denk gelir. Diğer bir önemli deprem de 2 no'lu 03 Mart 1969 depremidir. Bu depremin merkez üssü yine YGF üzerindedir. McKenzie (1972) depremin Ms: 5.8 büyüklükte olduğunu vurgularken, odak mekanizması çözümünün dikkat çekici bir şekilde farklı olarak ters faylanmayı işaret ettiğini belirtir. Bu alanda gerçekleşmiş bir başka önemli deprem ise Marmara Denizi'nin güneyinde ve Çan'ın kuzeyinde gerçekleşmiş 3 no'lu 05 Temmuz 1983 depremidir. Büyüklüğü Harvard deprem araştırma merkezine göre Ms: 6.1 olarak verilen deprem yine doğrultu atımlı bir karakterde çözüme sahiptir. Ana yapısal hatlara paralel uzanan KD – GB doğrultulu düzlem kuzeybatıya eğimli ve sağ yönlüdür ve bu çözümün genel tektonik çatı içinde uyumlu olduğu gözükmektedir.

Bu bölgede aletsel dönem içinde meydana gelmiş en önemli deprem ise Yenice Gönen Fayı üzerinde yüzey yırtılması gerçekleştirmiş olan 18 Mart 1953 depremidir. McKenzie (1972) depremin büyüklüğünü Ms: 7.2 olarak, ters çözümünü ise doğrultu atımlı olarak verir, fayın uzanımına paralel olan KD-GB doğrultulu düzlem sağ yanal bileşenlidir. Sismolojik kayıtlar incelendiğinde 1953 yılında meydana gelen ve Ms=7.2 büyüklüğündeki Yenice–Gönen Depremi için ana kayma düzleminin konumu 150°/84° olarak verilmekte, kayma vektörünün ise yatay düzlem ile 14° açı yaptığı belirtilmektedir (McKenzie, 1972). Deprem sırasında meydana gelen yüzey yırtılmasının ilk verileri Ketin & Roesli (1953)'de yayımlanmıştır. Çalışmacılar, Yenice asfalt yolunda 250 cm ve bazı toprak köy yollarında yanal yönde ötelenmeleri 430 cm olarak ölçmüşlerdir. Kürçer vd. (2008), yüzey kırığının Muratlar köyüne yakın bir alandaki Neojen sedimanlarında 10 cm düşeyde ve 1.5 metre sağ yanal ötelenmiş olduğunu belirtir. Çakır ve Seyvan arasında ise düşey yer değiştirmenin 1.5 metre civarında olduğunu rapor eder. Belindir (2008) ise 1953 depreminin yarattığı yüzey kırığındaki ötelenme miktarlarını fayın birçok farklı lokasyonlarında ve segmentlerinde çıkarmış ve atım dağılımlarınının geometrisini değerlendirmiştir. Çalışmacı atımların düşeyde 40 – 170 cm arasında değiştiğini, sağ yanal ötelenmenin ise yer yer 5 metreye yaklaştığını ifade eder. Ketin & Roesli (1953) , depremin yüzey kırığının 50 km olduğunu bildirir. Benzer şekilde Barka & Kadinsky-Cade (1988) yüzey kırığının 52 km olduğunu hesaplamıştır. Ambraseys & Jackson (1998) ise depremin büyüklüğünden yola çıkarak Wells & Coppersmith,

(1994) bağıntısına göre yüzey kırığının 58 km olması gerektiğini savunur. Ambraseys & Jackson (2000), gözlenen yüzey kırığının ölçülen bölümünün 55 km olduğunu rapor eder. Dolayısıyla gerek arazi gözlemleri gerekse ampirik yöntemlerle yüzey yırtılmasının 50 km ve yakın değerlerde olduğu sonucu ortaya çıkmaktadır.

5. PROJE ALANI VE ÇEVRESİ İÇİN SİSMİK KAYNAK TANIMLAMASI

Karlık (Balya) merkez kabul edilecek şekilde 100 km yarıçaplı bir alan içindeki diri faylar incelendiğinde 20 civarında sismik kaynağın bölgeyi etkileyebileceği görülmektedir (Şekil 5.1, Tablo 5.1). Literatürde Biga içine doğru ilerleyen Emre ve Doğan, (2010) ve Emre vd., (2011)'de tanımlanan, yaklaşık B – D ve DKD – BGB uzanımlı Yenice – Gönen, Çan – Biga, Bekten, Pazarköy, Evciler, Havran – Balıkesir ve Edremit Fay Zonları, bölgesel tektonik anlamında KAF ile birinci derecede ilişkili yapılar olarak değerlendirilirler. Bu verilere göre, çalışma alanı ve yakın çevresinde Mw=7.2 büyüklüğünde deprem oluşturabilecek 3 fay bulunmaktadır: 1-Yenice-Gönen Fayı, 2-Havran-Balıkesir Fay Zonu ve 3-Edremit Fayı. İzleyen bölümde bu üç fay tanımlanacak ve deprem üretme potansiyelleri konusunda bugüne kadar elde edilen bilgiler sunulacaktır.

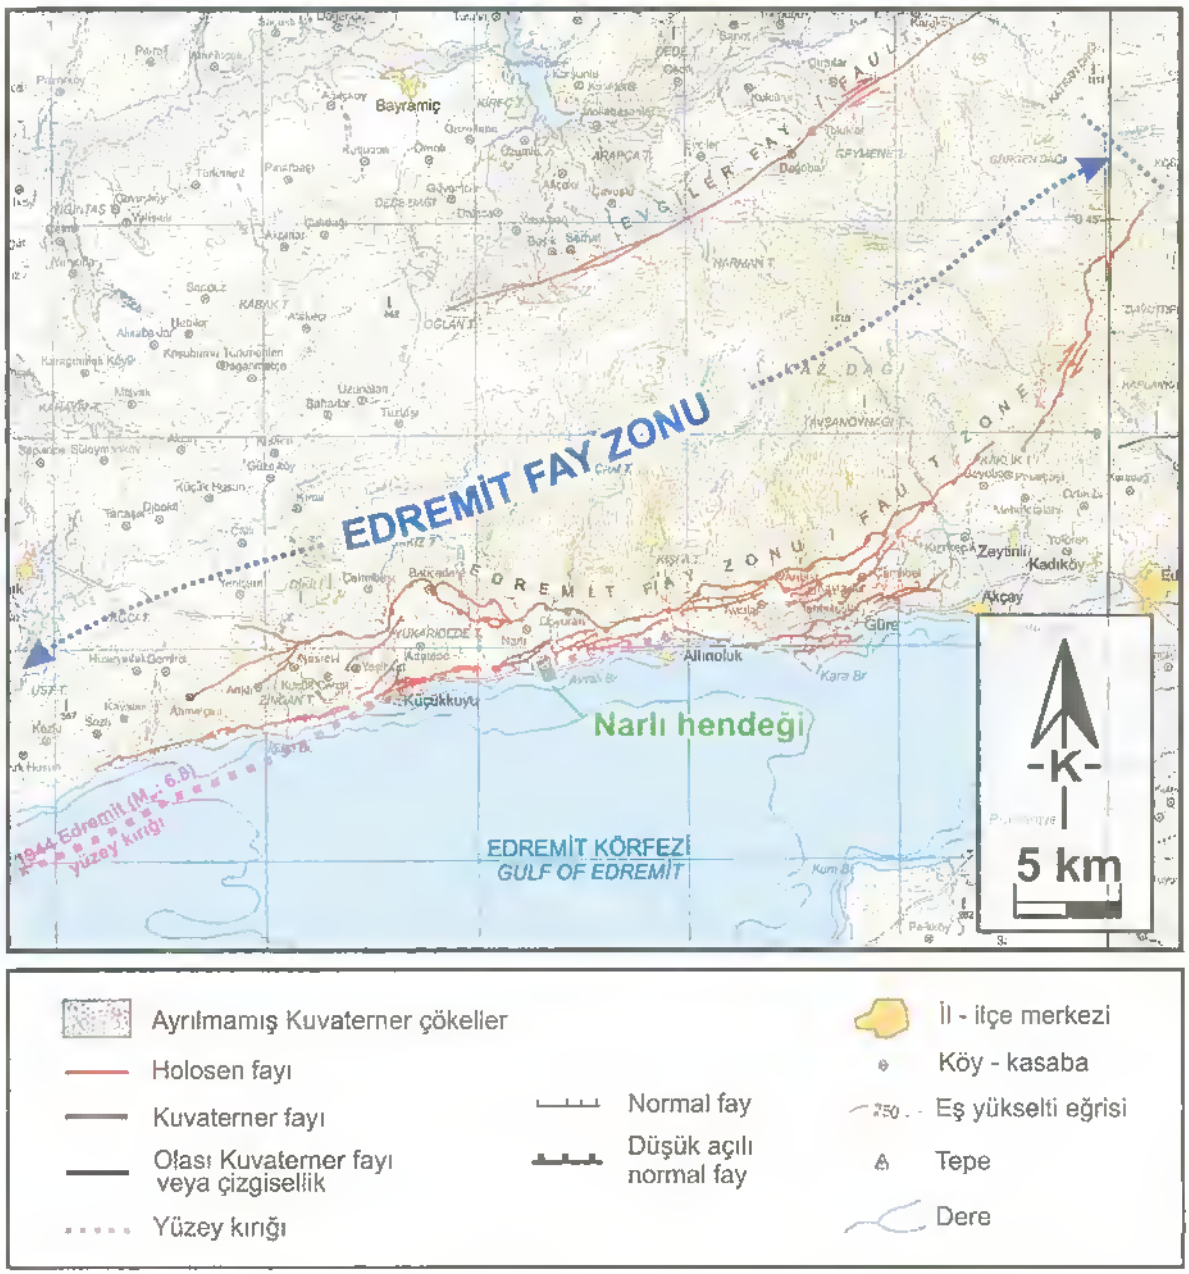
5.1 Edremit Fay Zonu Tanımı ve Segment Özellikleri

Edremit Fay Zonu, Biga Yarımadası güneyinde Edremit Körfezi ile Kazdağ yükselimi arasında yer alır (Şekil 5.2). Emre & Doğan (2010) tarafından yapılan adlandırma ile tanımlanan fay zonu, Edremit Körfezini kuzeyden boydan boya sınırlandıran ve doğu ucunda KD-GB doğrultusunu kazanarak Kalkım ilçesi batısına kadar uzanan düşük açılı ana bir normal fay ve bunun tavan bloğunda yer alan sintetik ve antitetik faylardan oluşan aktif bir fay sistemi şeklindedir (Şekil 5.2). Emre & Doğan (2010)'a göre, Babakale Burnu ile Kalkım arasında Edremit Fay Zonu'nun toplam uzunluğu 90 km' ye yaklaşır. Araştırmacılar, Kara morfolojisi ve körfezin batimetrisine göre, fay zonunun batıda Bababurnu açıklarına kadar Ege Denizi'nde su altında devam ettiğini ileri sürmektedirler. Yaltırak (2006) da Kazdağları'nın güney sınırında haritaladıkları fayların denizde de basamaklı olarak devam ettiğinin sığ ve derin sismiklerle yapılan kalınlık haritalarında gözlendiğini belirtir. Bazı çalışmacılar Biga Yarımadası'nı güneyden sınırlandıran Edremit Fay Zonu'nun Pliyo-Kuvaterner yaşlı olduğunu önerirler (Yılmaz & Karacık, 2001; Emre & Doğan, 2010).



Şekil 5.2. Edremit Fay Zonu'nu gösteren Diri Fay Haritası (Emre & Doğan, 2010). İşaretli dikdörtgen paleosismolojik amaçlı açılan Narlı hendeğinin yerini göstermektedir.

Bu çalışma kapsamında EFZ'nu oluşturan segmentler tanımlanırken, MTA'nın 1/250.000 ölçekli Türkiye Diri Fay Haritası Serisi Ayvalık NJ-35-2 paftası (Emre & Doğan, 2010) ve MTA (2012)'nın Biga Yarımadası için oluşturduğu raporunda, Emre vd., (2012)'deki adlamalara sadık kalınmıştır. Emre & Doğan (2010)'a göre Edremit Fay Zonu, yapısal örgüsü, geometrisi ve niteliğindeki değişimler dikkate

alınarak Altınoluk ve Zeytinli segmenti olmak üzere iki alt bölüme ayrılır. 60 km uzunluğundaki Altınoluk segmenti, K80°D genel doğrultusunda uzanan düşük açılı normal bir fay ve bunun tavan bloğunda gelişmiş, zonal bir yapı sunan sintetik ve antitetik faylardan oluşur. Doğu bölümünü oluşturan Zeytinli segmenti ise yaklaşık 15 km uzunluğunda olup K30°D genel gidişlidir. Araştırmacılara göre tek bir faydan oluşan Zeytinli segmenti, Altınoluk segmentindeki ana sıyrılma fayının devamı niteliğinde olup düzlemindeki kayma çiziklerine göre batı ucunda sağ yönlü doğrultu atım bileşenli normal fay niteliğinde doğu ucunda ise doğrultu atımı baskın bir verev faya dönüşür. Araştırmacılar, kuzeydeki sıyrılma fayının tavan bloğundaki yüksek açılı faylarda gözlenen ilksel morfolojisini koruyan fay sarplıklarının, Holosen'de fay zonu boyunca yüzey yırtılmasıyla sonuçlanan büyük depremler ile meydana geldiğini ileri sürmüşler, ancak sıyrılma fayının Holosen'de yüzey faylanmasına yorumlanabilecek bulgulara ulaşamamışlardır. Bu sıyrılma fayının oluşum mekanizması, literatürde farklı çalışmacılar tarafından farklı görüşlerle tanımlanır. Bu görüşler kronolojik sıra içinde aşağıda verilmiştir:

i) Lips (1998) de Kazdağları'nın Oligo-Miyosen'de K-G genişleme kuvvetleri etkisinde düşük açılı normal faylar (detachment Fault-Sıyrılma Fayları) boyunca yükseltildiği ilk kez belirtir.

ii) Okay vd. 1996 Orta Karbonifer'de (zirkon Pb-Pb yaşı: 308±16 My), Bingöl, 1968, 1969 Okay & Satır, 2000 ise Oligo-Miyosen'de (Rb-Sr ve K-Ar yaşı; 19-25 My), metamorfizmaya uğramış olan Kazdağı Grubu kayalarının düşük açılı normal faylar (sıyrılma fayları) boyunca yüzeylendiği ve daha sonra transpresyonal kuvvetler etkisinde doğrultu atımlı faylarla kesildiği belirtilmektedir (Okay & Satır, 2000; Duru vd., 2004)

iii) Yaltırak (2003, 2006), Yaltırak & Okay (2004)'e göre, Kazdağları'nın güney kenarı, Edremit Körfezi'nin K80°D doğrultulu kıyı çizgisine yaklaşık 10 derecelik açılar yapan sıçramalı bir geometriye sahip normal/oblik faylar ile şekillenir. Bu normal faylar, geç Oligosen-erken Miyosen Kazdağ Sıyrılma Fayı'nı keser ve taban bloğu üzerinde yer alan sıyrılma düzlemi askıda kalır. Araştırıcılara göre, Kazdağ Sıyrılma Fayı eklenir prizma ile dalan levha arasındaki Paleotetisin gömülü süturunun reaktivasyon zonuna karşılık gelir.

iv) Beccaletto & Steiner (2005), Kazdağları 'nın batı ucunda yaptıkları çalışmada Oligo-Miyosen-Kuvaterner zaman aralığında iki evreli grabenleşme geliştiğini belirtir. Araştırıcılara göre, Şelale sıyrılma fayı kontrölünde gelişen Oligo-Miyosen supradetachment havza oluşumu (Metamorfik çekirdek komplex modeli) Pliyo-Kuvaterner'de yüksek açılı normal faylar tarafından kesilmekte (Rift modeli) ve Edremit Grabeni'nin oluşumu gerçekleşmektedir. Cavazza vd. (2009) ve Bonev vd. (2009) Pliyo-Kuvaterner döneminin doğrultu atım ve normal faylanmann birlikte işlediği Kuzey Anadolu Fayı'nın gelişimiyle ilişkilendirmişlerdir.

v) Emre & Doğan (2010) tarafından yayınlanan 1/250.000 ölçekli Türkiye Diri Fay Haritası'nda, Edremit Körfezi ile Kazdağı Yükselimi arasında uzanan Edremit Fay Zonu, düşük açılı normal fay ve bu fayın tavan bloğunda yer alan sintetik ve antitetik faylardan oluşan aktif bir fay sistemi şeklinde tanımlanmıştır (Emre vd., 2011).

vi) Duru vd. (2012), Kazdağ Sıyrılma Fayı'nın Palaeotektonik dönemde bindirme fayı, Oligo-Miyosen döneminde sıyrılma fayı, Pliyo-Kuvaterner'de ise sağ yönlü doğrultu atımlı fay olarak çalıştığını belirtir.

vii) Demoulin vd. (2013) yaptıkları jeomorfolojik ve morfometrik hesaplara göre, Kazdağlarını da içeren Biga Yarımadası'nın kısa süreli bir sıkışma evresinde 0.8 My önce bir bütün olarak yükselmeye başladığını savunmuşlardır. Araştırıcılar, bu yükselmenin Eratosthenes Denizaltı Dağı'nın Kıbrıs Yayı altına daldığı zaman ile örtüştüğünü ve Kuzey Anadolu Fayı'nın bölgeye gelişiyle hızlandığını belirtmişlerdir.

viii) Bölgede yapılan son çalışma Erdoğan vd. (2013) tarafından gerçekleştirilmiştir. Araştırıcılar, Kazdağı Masifi'nin Alpin orojenezi sırasında nap paketleri altında kalarak metamorfizma geçirdiğini ve daha sonra post-metamorfik Oligo-Miyosen granitleri tarafından kesildiğini savunurlar. Önceki çalışmaların aksine, Kazdağı Masifi'nin sıyrılma fayları boyunca yükselmediği, sıyrılma faylarına karşılık gelen düzlemlerin aslında bindirme fayı oldukları ve dolayısıyla metamorfik çekirdek kompleksine uymadığını belirten araştırıcılara göre Kazdağları, Pleyistosen'den itibaren yüksek açılı normal faylar kontrolünde yükselmiş ve Edremit Körfezi'nin oluşumuna neden olmuştur.

Edremit Fay Zonu ile ilgili olarak yukarıda sunulan farklı görüşler nedeniyle, zon boyunca gözlenen düşük açılı normal fay ve yüksek açılı normal fayların ilişkisinin

saptanması ve hangi fay türünün aktif olduğunu belgelemek amacıyla zon boyunca jeolojik haritalama çalışmaları ve jeolojik gözlemler yapılmış, fay zonunun kuşak jeoloji haritası hazırlanmıştır. Hendek yeri belirleme çalışmalarına esas olmak üzere, Edremit Fay Zonu boyunca haritalanmış olan diri faylar arazide 1/25.000 ölçeğinde yeniden değerlendirilmiştir. Tarafımızdan yapılan jeolojik haritalama ve arazi gözlemlerine göre, Edremit Fay Zonu boyunca önceki çalışmalarda diri fay olarak haritalanmış olan bazı düşük açılı normal fay düzlemlerinin yüksek açılı fay düzlemleri tarafından kesildiği saptanmıştır. Bu nedenle Kazdağ Sıyrılma Fayı olarak da isimlendirilen düşük açılı fay, bu çalışmada diri fay sınıfında değerlendirilmemiştir.

5.2 Havran–Balıkesir Fay Zonu Tanımı ve Segment Özellikleri

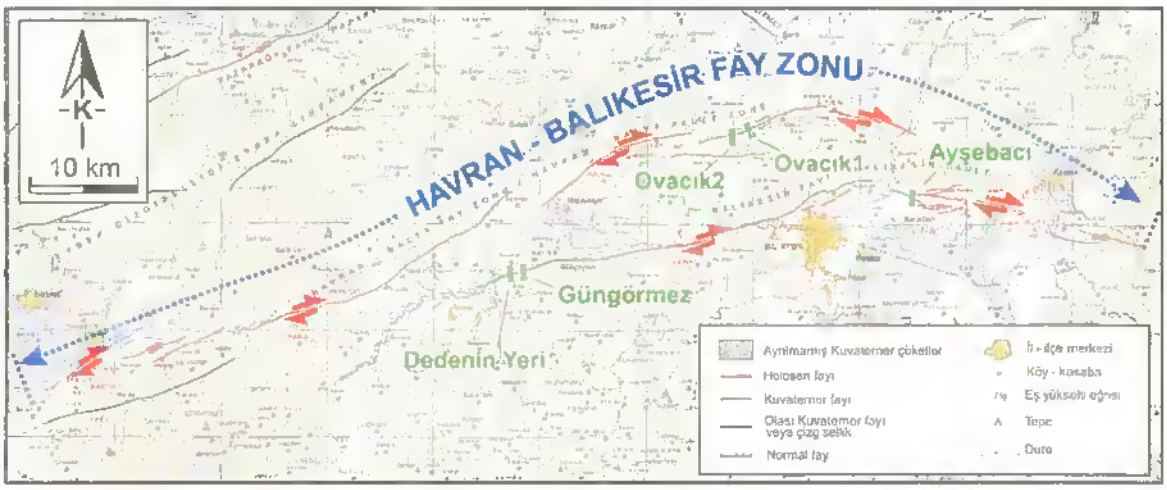
Bu çalışma kapsamında Havran–Balıkesir Fay Zonu (HBFZ)'nu oluşturan segmentler tanımlanırken bu fay zonu için MTA'nın 1/250.000 ölçekli Türkiye Diri Fay Haritası Balıkesir NJ-35-3 paftası (Emre vd., 2011) ve Duru vd. (2012)'nın Biga Yarımadası için oluşturduğu raporundaki adlamalar kullanılmıştır. Bu bağlamda, Edremit ile Balıkesir arasındaki alanda haritalanan 2-5 km uzunluğa ve 100-120 genişliğe sahip, yaklaşık K70°D uzanımlı, kuzeybatı ve güneybatıya eğimli birçok fay parçasından oluşan diri fay Havran–Balıkesir Fay Zonu olarak isimlendirilmiştir (Duru vd. 2012). Zon batıdan doğuya doğru; (i) Havran–Balya ve (ii) Balıkesir Fayı olmak üzere 2 ana faydan oluşur (Şekil 5.3; Emre vd., 2011). Yaklaşık 90 km uzunluğundaki bir Holosen Fayı olarak sınıflandırılmış olan Havran–Balya Fayı; (i) Havran, (ii) Osmanlar, (iii) Turplu ve (iv) Ovacık olmak üzere 4 fay segmentine ayrılır. Yaklaşık 65 km uzunluğa sahip olan ve yine Holosen fayı olarak sınıflandırılmış Balıkesir Fayı'nı oluşturan segment sayısı 2'dir ve batıdan doğuya doğru; (i) Gökçeyazı ve (ii) Kepsut Segmenti olarak isimlendirilmiştir.

Havran–Balya Fayı en batıda Küçükdere ve Hallaçlar köyleri arasında uzanan **Havran segmenti** ile başlar. Segment birbirine paralel/yarı paralel birçok fay parçasından oluşur. Harita ifadesinde, Edremit ovasının güney sınırı boyunca sağa sıçramalı bir geometri sunar. Ana segment boyunca gözlenen bu fayların dışında bazı R' Riedel fayları olarak tanımlanabilecek sol yönlü doğrultu atımlı faylar da haritalanmıştır. HBFZ' nin batı segmenti olan Havran Segmenti Holosen yaşlı alüvyal çökeller ile daha yaşlı kayaları birbirinden ayırarak Edremit ovasının

oluşumunu denetler. Morfolojik haritalar incelendiğinde bu oluşumu sağlayan ve Edremit ovasına dökülen vadi tabanlarında Havran segmenti boyunca sağ yönde ötelenmeler net bir şekilde belgelenmiştir.

Doğuya doğru gidildikçe Havran segmenti Gelin Deresi boyunca büyük bir sağa sıçrama yaparak **Osmanlar segmenti**' ne geçer. Hallaçlar Köyü'nün kuzeyinde Osmanlar Segmenti' ne ait fay parçaları Oligo-Miyosen yaşlı volkanik kayaçları keser ve yanal yönde öteleyerek Holosen yaşlı alüvyal çökeller ile yan yana getirir. Biraz daha doğuya doğru gidildikçe KD uzanımlı Belen Tepesi'nin kuzeybatı ve güneydoğu yamaçlarını şekillendiren Osmanlar Segmenti'ne ait fay parçaları Topuzlar ve Osmanlar yerleşimlerini kat ederek Kocaavşar Köyü civarında diğer bir büyük ölçekli sağ yönlü sıçrama ile Turplu segmentine geçer (Şekil 5.3).

Turplu segmenti yaklaşık 15 km uzunluğunda, 1 km genişliğinde, KD gidişli ve Kocaavşar ile Turplu yerleşimleri arasında uzanan S şekilli bir geometri sunar. Arazide ana yer değiştirme zonu olan Kocaçay Deresi'ne lokalize olmuş birçok R ve R' Riedel fay parçası gözlenebilir. Özellikle Oligo-Miyosen yaşlı volkanik kayaçlar ile Karakaya Kompleksine ait tortul kayaçlar iyi gelişmiş fay düzlemleri boyunca yoğun bir deformasyona uğramıştır. Bu segmentin ana KD gidişi arazide ve topoğrafik haritalarda belirgin bir şekilde izlenebilen fay sarplıkları, dağ önü çizgisellikleri, doğrusal/uzanımlı sırtlar, doğrusal vadi tabanları ve yükseltiler ile tipiktir. Turplu yerleşiminin kuzeyine gelindiğinde segment önemli bir dönüş yaparak doğrultusunu K50°D'dan K80°D'ya değiştirir. Bu dönüşten sonra segment son bularak sağ yönde yaptığı bir sıçrama ile Ovacık segmenti olarak isimlendirilen bölüme geçer.



Şekil 5.3. Havran-Balıkesir Fay Zonu' na ait segmentler ve üzerinde paleosismolojik amaçlı açılan hendek lokasyonlarını gösteren harita (Emre vd., 2011). İşaretli dikdörtgenler paleosismolojik amaçlı açılan hendek yerlerini göstermektedir.

Havran–Balya Fayı' nın en doğu bölümü, baskın olarak K65°D' dan K80°B' ya değişen uzanımlara sahip sağ yönlü doğrultu atımlı fay setlerinden oluşan **Ovacık segmenti** ile karakterize edilir. Saha verilerine göre bu segment Ovacık'ın batısında yaklaşık K70°D yönelim ile başlar ve Fethiye civarında K80°B doğrultusuna büklümlenir (Şekil 5.3). Bu segmentin etkisi altında gelişen sağ yönlü ötelenmeler faya ulaştığında S şeklinde bükülen dere tabanlarında da belgelenmiştir. Fethiye çevresinde bu segment genel olarak KD-GB uzanımlı olan ve nispeten daha küçük ölçekli fay parçaları içerir. Bu noktada birkaç sağ sıçramadan sonra HBFZ kuzeye ve doğuya doğru daha fazla izlenemez (Şekil 5.3).

Balıkesir Fayı' nın batı ucunu oluşturan 40 km uzunluğunda, 2-5 km genişliğinde ve K70°D yönelimli olan **Gökçeyazı Segmenti**, HBFZ'nin en belirgin yapısı olarak göze çarpar. Bu segment yan yana dizili drenaj sistemleri, paralel/yarı paralel vadiler, bükülmüş vadi tabanları, uzamış tepeler ve taze fay yüzlekleri gibi sahip olduğu jeomorfolojik özellikler ile topografik haritalarda ve uydu görüntülerinde kolayca izlenebilmektedir. Drenaj ağları ve vadi tabanlarında izlenen KKD-GGB ve KKB-GGD yönelimler bu bölgedeki fayların ve ana çizgiselliklerin topografyadaki etkisini göstermektedir. Özellikle Gökçeyazı'nın batısında ve doğusunda Karakaya Kompleksi ve İzmir–Ankara Zonu kayaları ile Miyosen volkano-sedimanter kayaçlar arasındaki stratigrafik dokanaklar harita ifadesinde bu segment boyunca sağ yanal

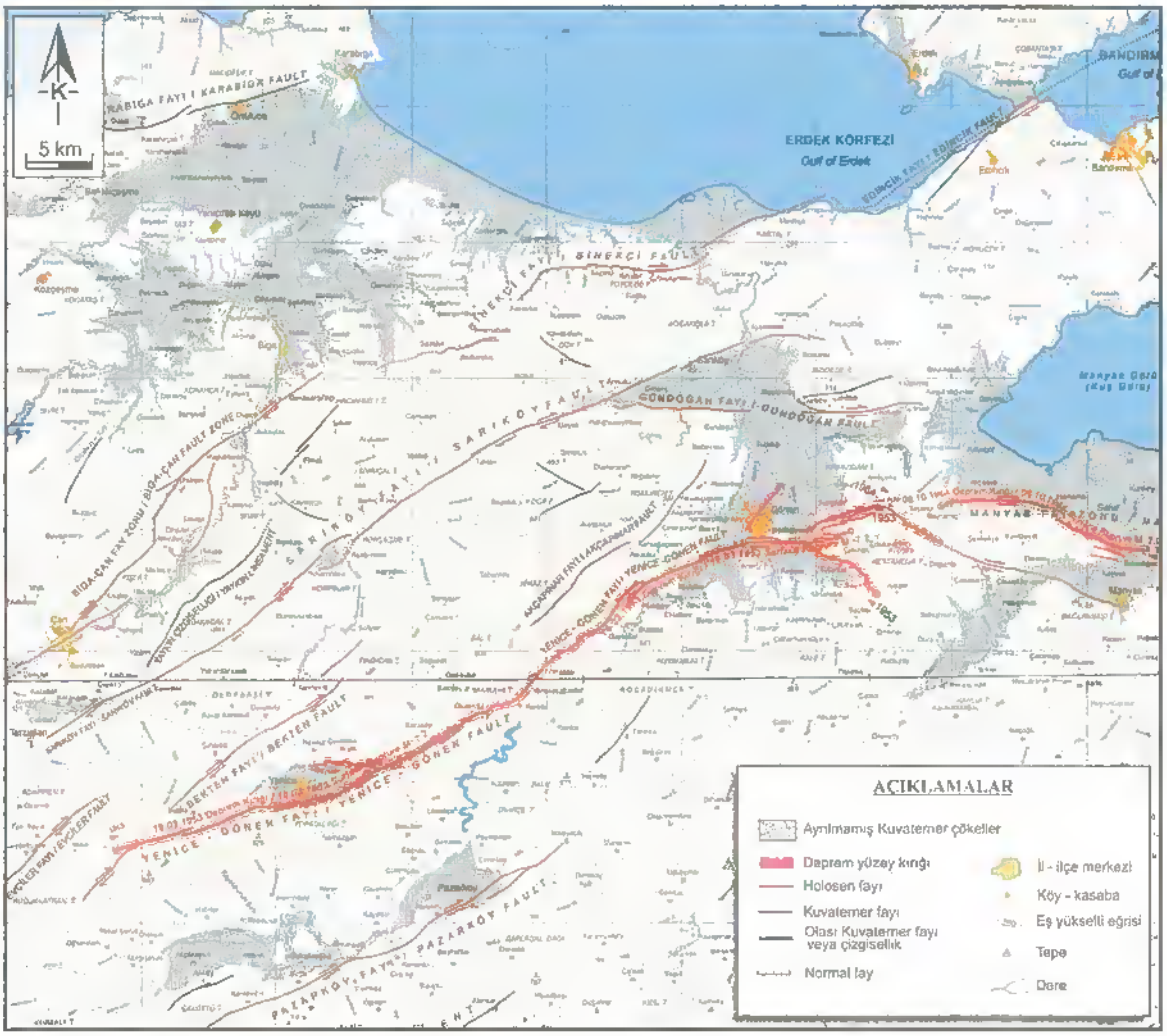
yönde belirgin bir şekilde ötelenmiştir. İvrindi'nin doğusunda birbirine paralel/yarı paralel ve yaklaşık 80°D'ya eğimli olan fay parçalarından oluşan Gökçeyazı segmenti Karakaya Kompleksi ve İzmir-Ankara Zonu'na ait kayaçlar ile Oligo-Miyosen yaşlı birimler ve Pliyosen yaşlı İlyasbaşı Formasyonu'nu keser ve yanal yönde öteler. Bu alandaki genç akarsuların aşındırdığı vadi tabanlarında Gökçeyazı segmenti boyunca gözlenen sağ yanal ötelenmeler, topoğrafik haritalar ve uydu görüntülerinde net olarak izlenebilmektedir. Bu noktadan sonra segment Koca Dere boyunca Kurçalı Tepe'nin kuzey yamacını şekillendirerek Balıkesir yerleşim alanına kuzeden girer. Topografik haritalar ile uydu görüntülerinde Ayşebacı'nın kuzeybatısına kadar izlenebilen Gökçeyazı segmentine ait K60–70°D çizgiselliği bu alanda yaklaşık K85°D doğrultusuna bükülerek sağa yaptığı bir sıçrama ile Kepsut segmenti' ne geçer (Şekil 5.3).

Ayşebacı ve Eyüpbükü köyleri arasında uzanan HBFZ'nin en doğu bölümü, en az 7 fay setinden oluşan, 25 km uzunluğa ve 1–3 km genişliğe sahip olan K70°B yönelimli Kepsut Segmenti ile karakterize edilir. Bu fay parçalarının her biri en fazla 10 km civarında izlenebilmektedir. Kepsut segmenti Karaman'nın kuzeyindeki bölgede topoğrafyadaki ani kırılmalar şeklinde net bir şekilde izlenebilir. Bağlarbayırı Tepe'nin güneybatı yamacındaki Miyosen yaşlı volkano-sedimanter kayaçlar içerisinde segmente ait fay basamakları Ayşebacı'dan itibaren doğuya doğru dallar halinde ilerleyen ve güneye doğru eğimli olan fay parçalarının morfolojideki izlerini yansıtır. Kepsut'un kuzeyinde tekrar tek bir ana yer değiştirme zonuna lokalize olan segment Eyüpbükü'ne dek izlenebilir. Eyüpbükü'nün hemen doğusunda İzmir–Ankara Zonu kayaları ile Miyosen yaşlı volkano-sedimanter kayaçlar arasındaki stratigrafik dokanağın harita ifadesinde sağ yanal yönde belirgin bir şekilde ötelendiği görülür. Harita ifadesinde sağ yanal doğrultu atımlı HBFZ'nin en doğu ucunda açılan Balıkesir ovasının, bu zonun eğim atımlı Kepsut segmenti tarafından kontrol edilen bir fay ucu havzası olarak geliştiği jeolojik ve morfolojik haritalardan izlenebilmektedir (Şekil 5.3).

5.3 Yenice-Gönen Fayı Tanımı ve Segment Özellikleri

Biga Yarımadası kuzeydoğusunda, Balıkesir ve Çanakkale il sınırları içinde yer alan Yenice-Gönen Fayı, güneybatıda Yenice ilçesi civarından kuzeydoğuya doğru, Gönen doğusundaki Tütüncü ilçesine dek uzanır. Bu alanda yaklaşık 67 km

uzunluğa sahip olan fayın genel doğrultusu K65°D'dir (Şekil 5.4). Ms=7.2 büyüklüğündeki 1953 Yenice-Gönen depremiyle fayın Holosen dönemdeki aktivitesi belgelenmiştir. Bu depremde gelişen sağ yönlü doğrultu atımlı faylanma ile ilişkili yüzey kırıkları Ketin ve Roesli (1953) tarafından haritalanmıştır. Daha sonra bu fay, Ketin (1969) tarafından Kuzey Anadolu Fay Sistemi içerisine dahil edilerek değerlendirilmiştir. Şaroğlu vd. (1987, 1992) ile Emre vd. (2011a, 2011b) tarafından düzenlenen Türkiye Diri Fay Haritalarında da yer alan fay ile ilgili tanımlayıcı bilgiler MTA'nın 2012 yılı Biga raporunda geçer (Duru ve diğ, 2012). Bu raporda Yenice-Gönen Fayı'nın morfolojide oluşturduğu belirgin çizgisellikler ile karakteristik olduğu belirtilir. Fayın Yenice kuzeyinde kalan bölümü genel olarak Oligo-Miyosen yaşlı Hallaçlar volkanitlerini keser.



Şekil 5.4. Yenice-Gönen Fayı ve Çevresinin Diri Fay Haritası. Bölgenin diri fayları Emre vd. (2011a ve 2011b)'den alınmıştır.

Gönen civarına geldiğinde fay Pliyosen yaşlı Bayramiç formasyonu ile Kuvaterner yaşlı güncel dere çökellerini kesip deforme eder (Duru ve diğ, 2012). Rapora göre fay bu noktadan sonra Muratlar Köyü civarında, Hallaçlar volkanitleri ile Bayramiç formasyonu arasındaki yapısal sınırı oluşturarak bazı dokanaklarda yaklaşık 1.5 km'lik sağ yönlü ötelenmelere sebep olur. Yenice ilçesinin de üzerine kurulduğu Kuvaterner Yenice havzası, bu fayın kontrolünde gelişen bir çöküntü alanıdır. Bu bilgilere göre fay, bu havza çökelleri içerisinde de izlenebilir nitelikte deformasyon yapıları ve kesilmelere sebep olmuştur. Yenice-Gönen Fayı boyunca, Yenice ilçesi civarında Kuvaterner yaşlı alüvyal çökellerin ile granitoyidlerin, Sazak civarında ise önce Yenice granitoyidi ile Kalabak Grubuna ait metamorfik kayaçaların ve daha sonra ise çeşitli yaş ve türdeki tortul (Karakaya Melanjı) ve metamorfik birimlerin (Kalabak Grubu) fay boyunca karşı karşıya geldiği görülür. Rapora göre Yenice havzası fay zonu içerisindeki bir çek-ayır havza niteliğindedir ve bu havzanın kuzey ve güney bloklarında yüzlek veren Oligo-Miyosen yaşlı Hallaçlar volkanitlerinin dokanakları boyunca yaklaşık 5 km lik bir sağ yönlü atım gözlenmektedir (Duru vd., 2012).

Fay ile ilgili önemli çalışmalardan biri de Dirik vd. (2008) tarafından gerçekleştirilmiş olan bir çalışmadır. Bu çalışmada Yenice-Gönen Fayı boyunca gelişen yüzey kırığı haritalanarak faylanmanın kinematik özellikleri tanımlanmıştır. Araştırmacılara göre fay 8 segmentten oluşur. Bunlar batıdan doğuya doğru; Kerpiçlik, Basalan, Sazak, Yenice, Seyvan-Karasu, Ortaoba-Gaybular, Muratlar ve Gönen olarak isimlendirilmiştir. Bu segmentlerin uzunlukları yaklaşık 2 ile 16 km arasında değişir ve sırasıyla 780 m genişliğinde genişlemeli sıçrama, 550 m genişliğinde genişlemeli sıçrama (Sazak havzası), 19° açı ile sıkışmalı büklüm, fayın doğrultusundaki belirgin değişim, 1.25 km genişlikte sıkışmalı sıçrama, 17° açı ile sıkışmalı büklüm ve fayın kollara ayrılması gibi özelliklerle birbirlerinden ayırtlanırlar.

Yenice-Gönen Fayı boyunca doğrultu atımlı deformasyona özgü (ötelenmiş sırt ve dereler, topoğrafik kesilmeler ve boyunlar, basınç sırtları vb.) morfolojik yapılar yaygın olarak izlenir (Herece, 1985; 1990; Şaroğlu ve diğerleri,1987; Tokay ve Dirik,

2004; Kürçer, 2006; Dirik, 2008). Fay tarafından kesilen Holosen yaşlı akarsu drenajlarında yine sağ yanal yönde atımlar belirgindir (Dirik, 2008).

Yenice-Gönen Fayının ana kollarından biri kabul edilen Bekten Fayı (Gürer vd., 2006; Şaroğlu vd., 1992; Siyako vd., 1989; MTA, 2012; Emre vd., 2011a; 2011b; Özalp vd., 2016), Yenice ilçe merkezinin kuzeyindeki Sofular ile Sazak Köyleri arasında uzanır. Yaklaşık 19 km uzunluğunda ve K50°D doğrultulu olan bu diri fay, iki büyük doğrultu atımlı fay sistemini oluşturan Sarıköy Fayı ve Yenice-Gönen Fayı arasında, bu faylara paralel olarak uzanır. Sarıköy fayına uzaklığı yaklaşık 10 km, güneybatı ucunda Yenice-Gönen fayına olan uzaklığı ise kabaca 2 km'dir.

Bekten Fayı geometrik olarak; (i) Sazak-Bekten ve (ii) Bekten-Sofular arası olmak üzere iki alt parçada tanımlanmıştır. Sazak ile Bekten arasında yer alan ve yaklaşık 15 km uzunluktaki K50°D doğrultulu parça, batı ucunda Karakaya ve Sazak formasyonları arasındaki yapısal dokanağı oluşturur ve Davutköy güneyinde sağ yönde yaklaşık 5 km uzunlukta bir büklüm yaparak K45°D doğrultusunu kazanır. Bu alan fay boyunca gelişen bir "açılmalı büklüm" olarak nitelenir ve Bekten ovası bu açılmalı alanda gelişmiştir. Sazak ile Bekten arasında kalan bu fay parçası çizgisel gidişi ve doğrultu atım morfolojisi sunan bir topoğrafya ile simgelenir. İnceleme alanının da üzerinde bulunduğu Bekten-Sofular arasındaki ikinci fay parçası yaklaşık 4 km uzunluğundadır ve metamorfiklerden oluşan Kalabak Grubu içinde izlenir (MTA, 2012)

Bekten Fayı ile ilgili en yeni çalışma Özalp vd. (2016) tarafından gerçekleştirilmiştir. Çalışmacılara göre Bekten Fayı, genel olarak KD-GB doğrultuludur ve kendisine paralel uzanan sağ yanal atımlı Yenice-Gönen, Sarıköy ve Evciler fayları ile birlikte bölgenin başlıca deformasyon yapılarını oluşturur. Bekten Fayı boyunca yaptıkları gözlemlere dayanarak fayı 20 km uzunluğa sahip, K55°D doğrultulu, oblik bileşene sahip bir ters fay olarak tanımlarlar. Harita ölçeğinde, Yenice-Gönen Fayı'nın yaklaşık 2 km güneybatısı ile Sarıköy Fayı'nın yaklaşık 7 km kuzeydoğusunda sonlandığı görülür.

Tüm bu veriler ışığında, Ruhsat sahasına 11 km uzaklıktaki Havran-Balya Fay Zonu ana sismik kaynak olarak değerlendirilmiştir. 4 segmentten oluşan Havran-Balya Fay Zonu toplam 84 km uzunluğunda olup (Emre vd. 2013), üretebileceği maksimum deprem büyüklüğü 7.3'tür (Wells ve Coopersmith 1996).

6. SİSMİK TEHLİKE VE RİSK ÇALIŞMALARI

Hasar ve can kaybı yaratabilecek büyüklükte bir depremin belli bir yer ve zamanda meydana gelme olasılığına **Sismik (Deprem) Tehlike** denir. Herhangi bir bölge veya ülkede deprem kaynaklı afet zararlarının azaltılması yönünde yapılacak tüm çalışmaların başarısı deprem tehlikesinin en güvenilir şekilde tanımlanmasına bağlıdır. Bir bölge için deprem tehlikesi araştırılırken hedef alınan konular "gelecekte deprem nerede, hangi büyüklükte ve ne zaman olacaktır" şeklindedir.

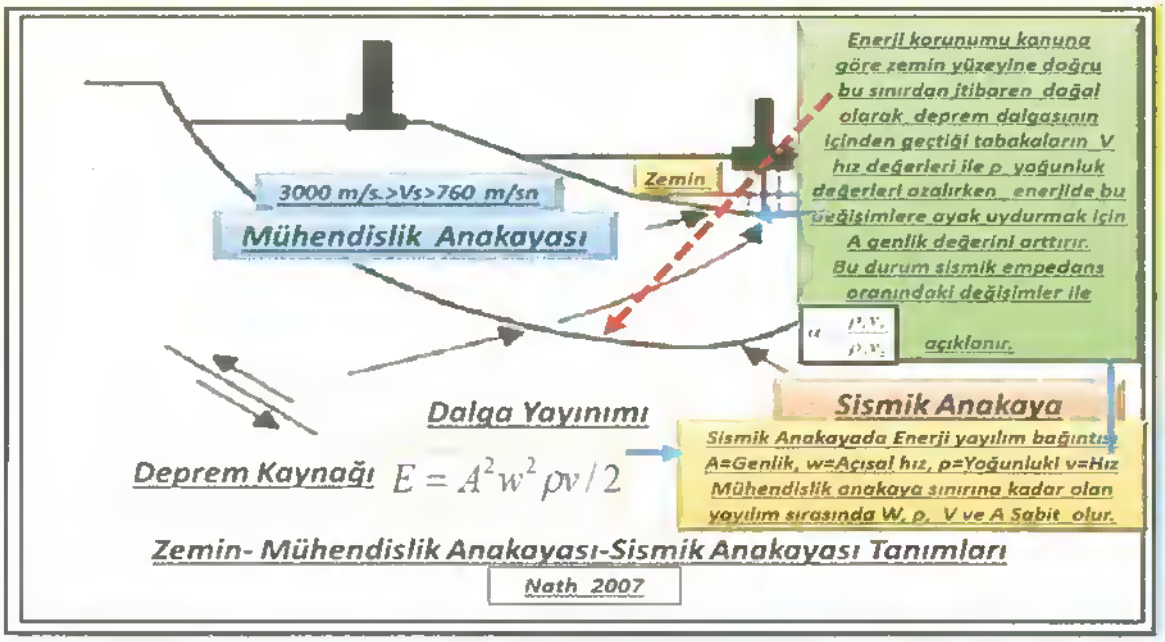
Yeraltında elastik enerji birikimine ve daha sonra yayılımına neden olan tüm olaylar deprem kaynağı olarak tanımlanır. Bu olaylar Elastik Rebound Kuramı ile tanımlanır. Elastik Rebound Kuramı'na göre deprem kaynağı mevcut fay şeklinde tekrar hareket eder veya yeni faylar oluşması şeklinde iki farklı şekilde oluşabilir. Tektonik depremleri oluşturan enerji kaynağı, yer kabuğu içinde zamanla depolanan potansiyel enerjidir. Elastik yenilme kuramına göre; yer kabuğunda birbirine komşu olan blokların, tektonik kuvvetlerin etkisiyle birbirlerine göre yavaş yavaş kaymaları sonucu, yer kabuğu içinde bu hareket sınırlarında elastik deformasyon enerjisi depolanır. Deformasyonla ilgili bu gerilmelerin küçük bir bölgede sürtünme direncini aşması sonucu yerel bir kayma oluşur. Bu şekilde açığa çıkan enerjinin bir kısmı elastik dalgalar halinde yer içerisinde yayılır, bir kısmı ise ısı ve mekanik enerji halinde kaynak civarında harcanır. Sonuç olarak, biriken enerji ya mevcut fayı tekrar harekete geçirir ya da kırılma oluşturarak yeni faylar oluşturur.

Deprem kaynağından çıkan deprem dalgalarının yer içinde yayılmasını tanımlarken enerjinin korunumu yasası kullanılır. Bu yasaya göre $E=A^2.w^2.\rho.v$ bağıntısı kullanılır. Bu bağıntıya göre enerjinin deprem kaynağından zemin yüzeyine kadar yapacağı seyahat boyunca sabit kalması temel alınır. Bu varsayımın geçerli olması için zemin yüzeyine yaklaştıkça açısal hız (w) sabit kalırken, doğanın yasası gereği azalan yoğunluk (ρ) ve sismik hız (v) değerlerini karşılamak için genlik (A) artışları oluşur.

Bu olaylar sismik anakaya olarak tanımlanan (Vs>3000m/s) sınırdan itibaren başlar (Şekil 6.1). Genlik artış katsayısını hesaplamak için $B=1/((1/\alpha)+(\Pi/2)\xi)$ bağıntısı kullanılır. Sismik anakaya sınırından itibaren sismik S dalga hız değerlerinde

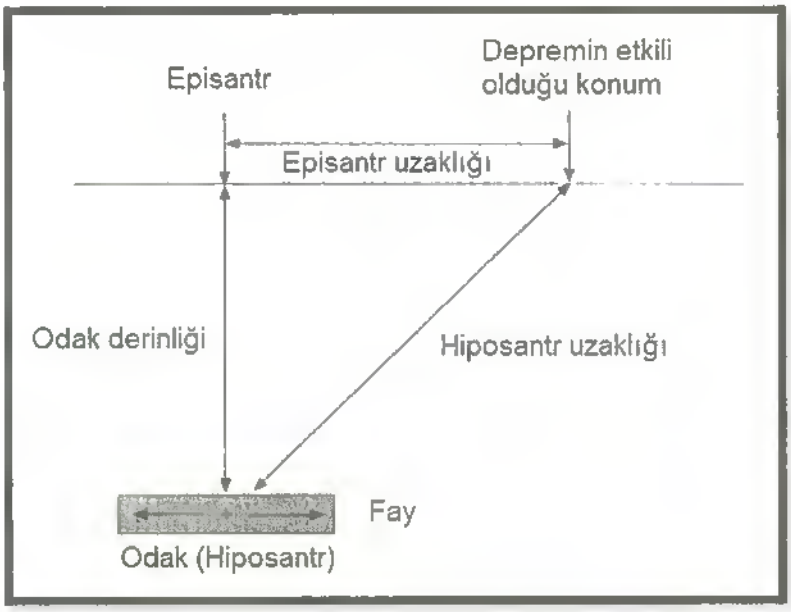
oluşacak olan genlik artışlarının hangi periyot değerlerinde oluşacağı **To=4H/Vs** bağıntısı ile hesaplanır. Periyot değerini tabaka kalınlığı arttırırken Vs dalga hız değeri azaltır. Bağıntılarda yer alan terimlerin açıklamaları aşağıda verilmiştir.

- Sismik empedans oranı; **$\alpha=(\rho_2V_2)/(\rho_1V_1)$**'dir. Alttaki ($\rho_2V_2$) ve üstteki ($\rho_1V_1$) tabakalar arasındaki sınırda yoğunluk ve sismik hız değişimlerine bağlı olarak oluşan sismik empedans oran değeri olarak tanımlanır. α değerini arttırır.
- Diğer terim olan sönüm oranı **$\xi=(nw)/(2G)$** bağıntısı ile tanımlanır. Sönüm oranı bağıntısında yer alan terimler n=viskozite, w=açısal hız ve G=kayma modülüdür. Viskozite ve açısal hız değerleri sönümü arttırırken kayma modülü değeri de sönümü azaltır. Genellikle kaya ortamlar için 0.02 ve yumuşak ortamlar içinde 0.05 olarak tanımlanır.

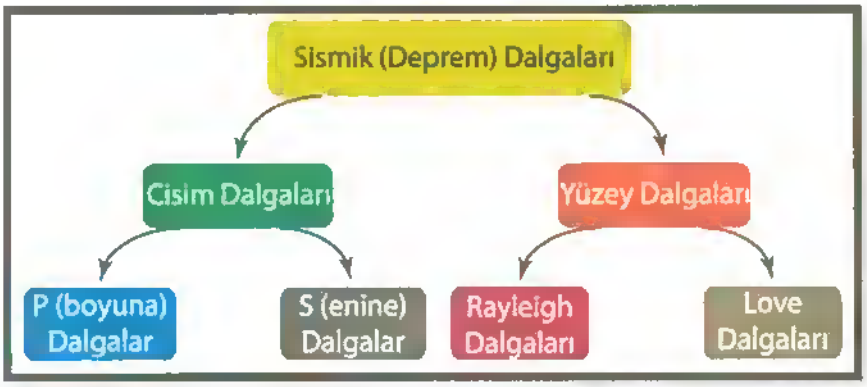


Şekil 6.1 Sismik tehlike analizi çalışmalarında temel alınması gereken zemin anakaya modeli.

Deprem ile ilgili kaynak parametreleri Şekil 6.2'de tanımlandığı gibidir. Bu kavramlara göre sismik tehlike analizi çalışmalarında gerekli olan parametreler kaynağın ruhsat alanına göre koordinatları ve kaynaktan çıkan enerjinin büyüklüğü (Magnitüd) olmaktadır. Ayrıca deprem dalgaları kaynak ve zemin yüzeyi arasında hareket ederken cisim ve yüzey dalgaları olarak yayılım gösterirler (Şekil 6.3).



Şekil 6.2 Deprem oluşumu ve tanımlama parametreleri



Şekil 6.3 Deprem dalga sınıflaması

Deprem dalgalarının arasındaki fark ve bu farkın önemi nedir sorunun yanıtı; zemin yüzeyine ulaşan deprem dalgaları zemin yüzeyinde titreşim hareketi oluşturur. Bu hareket sonucunda zemin yüzeyinde bulunan yapılar harekete geçer. Sismik S dalgaları (yatay yönde ve şekilsel değişim yaratan) yapılara asıl hasar veren etkidir. Bu nedenle zemin yüzeyine kadar S dalga hızındaki değişiminin araştırılması, S dalga hızına göre zemin anakaya modellerinin oluşturulması gerekir.

6.1 Depremler Sırasında Zemin Yüzeyinde Oluşan Yer Hareketini Tanımlayan Zaman ve Frekans Ortamı Parametreleri

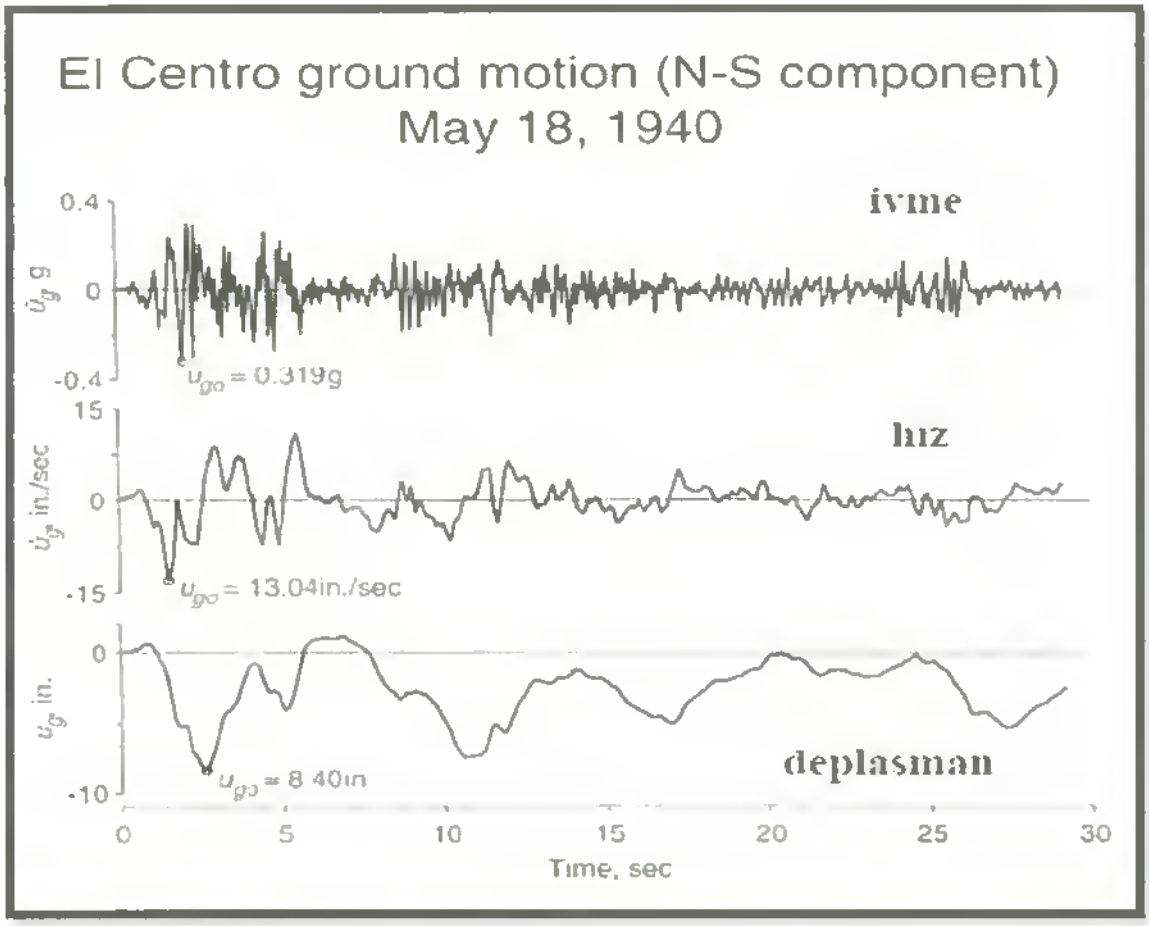
Depremin kaynaktan çıkan enerjisi magnitüd ile tanımlanır. Bu enerji miktarı uzaklıkla azalır. Bu azalma üzerinde etkili olan yerel zemin koşulları olur. Çünkü zemin özellikleri zemin yüzeyindeki sarsıntı etkisini büyütebilir veya küçültebilir. Zemin yüzeyinde oluşan deprem hareketini zaman ve frekans ortamında tanımlamak için bazı parametreler kullanılır. Zaman ortamında kullanılan parametreler aşağıda özetlenmiştir (Şekil 6.4)

- **İvme;** kuvvetli yer hareketi (KYH) istasyonları ile ölçülür. İvmeölçer adı verilen sensörler kullanılır. Deprem sırasında oluşan zemin davranışına ait ivme değerlerinden yapılara etkiyen atalet kuvvetleri yani zemin hareketine bağlı yapıda deprem etkisine bağlı gelişen tepkiler belirlenebilir.

- **Hız;** hızölçer sismometreleri ile ölçülür. Deprem-zemin ortak davranışı sonucunda oluşan enerjinin bir kısmı zemin ve farklı mekanizmaların gerçekleştiği (lineer ve lineer olmayan sönüm, doğrusal olmayan malzeme davranışı) yapı tarafından soğurulur. Hız verileri ile yapılara geçen maksimum enerji değeri hakkında bilgi sağlanır.

- **Yer değiştirme;** zemin yüzeyinde oluşan yer değiştirmenin veya şekil değiştirmenin büyüklüğü ile ilişkilidir.

- **Süre;** bir fay boyunca biriken deformasyon enerjisinin yırtılması ile ortaya çıkan enerjini boşalma süresidir; yapılar için özellikle güçlü/kuvvetli yer hareketi süresi önemlidir. Yırtılan fayın uzunluğu veya alanı büyürken, yırtılma süresi uzar ve artan deprem büyüklüğü ile beraber kuvvetli hareketinin süresi de uzar. Deprem sonrası yapısal hasarlar üzerinde yapılan gözlemler kuvvetli yer hareketi süresinin "deprem can ve mal kayıpları" üzerinde çok etkili olduğunu göstermiştir.

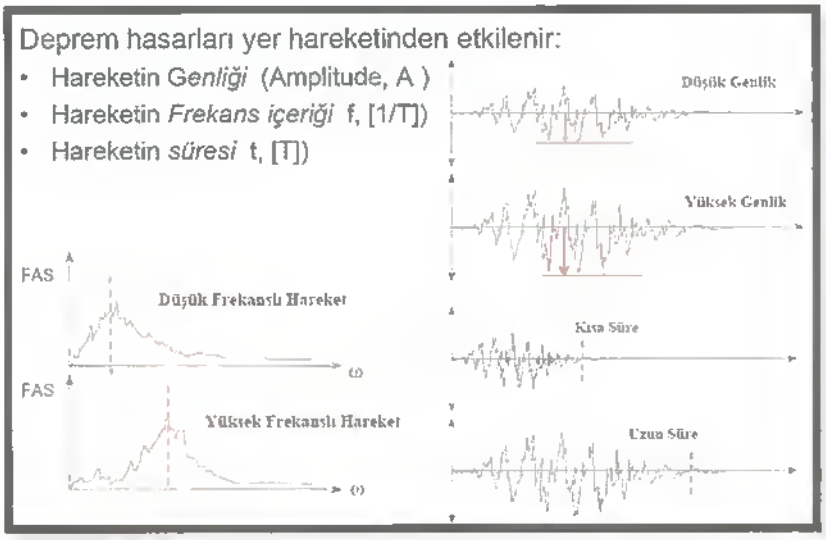


Şekil 6.4 Deprem hareketine ait zaman ortamı genlik parametrelerini açıklayan şekil.

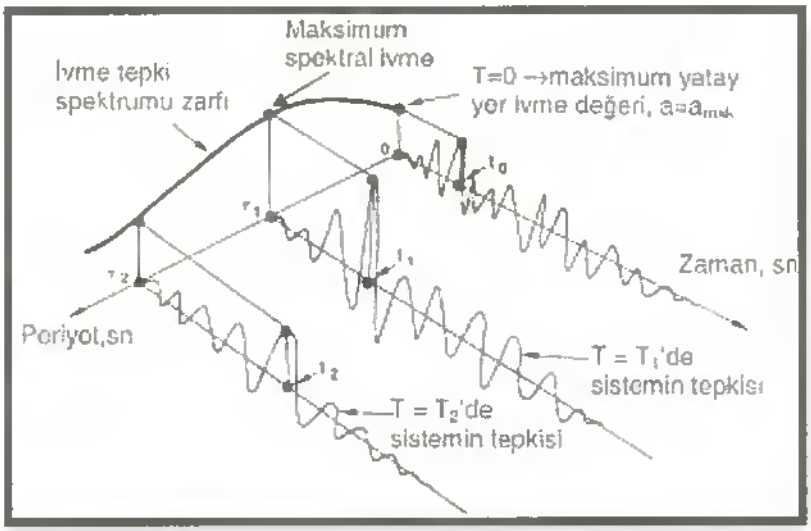
Deprem sırasında zemin yüzeyinde oluşan titreşim hareketini tanımlayan frekans ortamı parametreleri yer hareketinin frekans içeriği ve tepki spektrumları kavramları ile tanımlanır (Şekil 6.5 ve 6.6). Yapıların deprem etkilerine gösterdikleri tepki ile direkt ilişkili olan tepki spektrumları aşağıdaki gibidir:

- İvme tepki spektrumu (yer hareketi + binanın dinamik tepkisine ilişkin bilgi içerir),
- Hız tepki spektrumu (yer hareketi + binanın dinamik tepkisine ilişkin bilgi içerir),
- Yer değiştirme tepki spektrumu (yer hareketi + binanın dinamik tepkisiyle ilişkilidir),

- Baskın (hâkim) frekans bölgesi (sadece yer hareketine ilişkin bilgi içerir – yapının dinamik tepkisine ilişkin bilgi içermez).



Şekil 6.5 Zemin yüzeyinde oluşan deprem zemin ortak davranışını zaman ve frekans ortamlarında tanımlamakta kullanılan parametreler.



Şekil 6.6 Tepki Spektrum Kavramı ile Zemin Davranışının Yapılar Üzerindeki Etkilerinin Araştırılması.

Bu aşamada bir bölge için sismik tehlike analizi çalışmaları yapılırken göz önüne alınması gereken konular; zemin yüzeyindeki deprem hareketinin zaman ve frekans ortamı parametre değerlerinde değişim yaratabilecek yerel zemin koşullarının araştırılıp tanımlanması olmalıdır. Aşağıda deprem hareketinin zaman ve frekans ortamındaki parametreleri üzerinde değişime neden olabilecek olaylar özetlenmiştir.

Bilindiği gibi deprem hareketinin frekans içeriği, depreme bağımlı oluşacak hareketin genliğinin değişik frekanslar arasında nasıl dağıldığını tanımlamaktadır. Dinamik davranış analizlerinde, yer hareketini tanımlamak için sadece maksimum ivme değerine bakarak karar vermek yanıltıcı olabilmektedir.

Örneğin maksimum ivmesi büyük bir deprem düşünüldüğü kadar zarar verici olmayabilirken, maksimum ivmesi küçük olan bir deprem beklenilenden daha fazla yıkıcı olabilir.

Ayrıca, deprem etkisine maruz kalacak yapıların salınım periyotlarının, deprem-zemin ortak davranış hareketinin baskın periyoduna yakın değerlerde olması durumunda depremin maksimum ivmesi küçük olsa dahi oluşturacağı hasar büyük olabilmektedir.

Bunun için zemin özelliklerine göre sahaya özgün tasarım yer hareketi parametrelerinin araştırılması gerekir. Sahaya özgün tasarım spektrum hazırlarken yapılması gereken çalışmalar;

- Çalışma alanını etkileyebilecek potansiyel sismik kaynakları araştırılarak çalışma alanına göre konumları tanımlanır.
- Araştırılan sismik kaynakların, deprem yaratabilme özellikleri ve depremselliği araştırılır.
- Olası deprem kaynağı ile çalışma alanı arasındaki deprem dalgalarının geçtikleri ortamın deprem dalgalarının zaman ve frekans ortamında yapabileceği genlik değişimleri belirlenir.
- Vs < 760 m/s özelliğe sahip yerel zeminin özellikleri araştırılmalıdır.
- Yapılacak yapı veya tesisin öneminin tanımlanması yapılmalıdır.

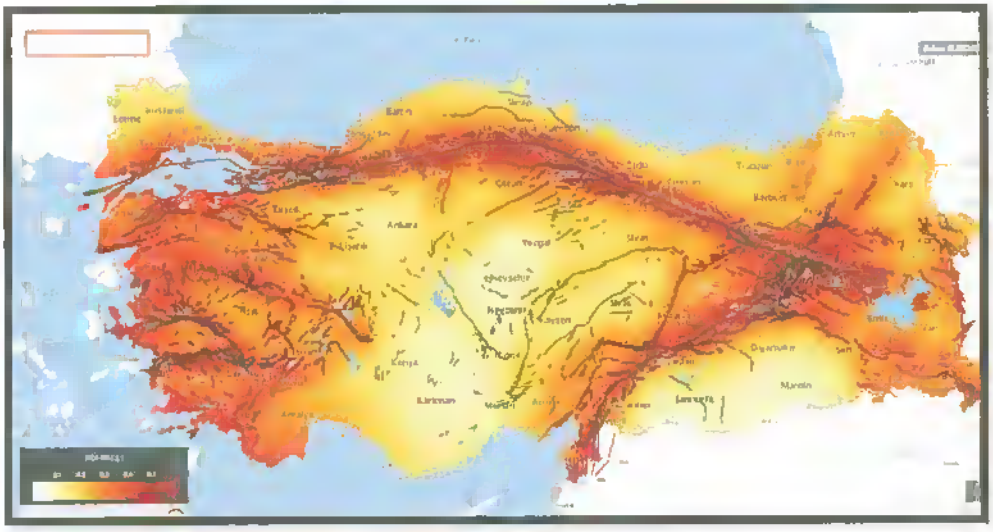
Bu çalışmaların amacını oluşturan depreme dayanıklı yapı tasarımının hedefi, yapıların kontrollü hasar görmesini sağlayarak (göçme seviyesinde, can güvenliği ve/veya üretimi aksatacak bir hasar olmaksızın) belirli bir yer hareketi seviyesine dayanacak şekilde inşa etmektir. Bu koşulun sağlanması için yapı yapılacak alana

özgün tanımlanacak yer hareketi seviyesi kullanılarak *"tasarım yer hareketi"* zaman ve spektral ortamda tanımlanır.

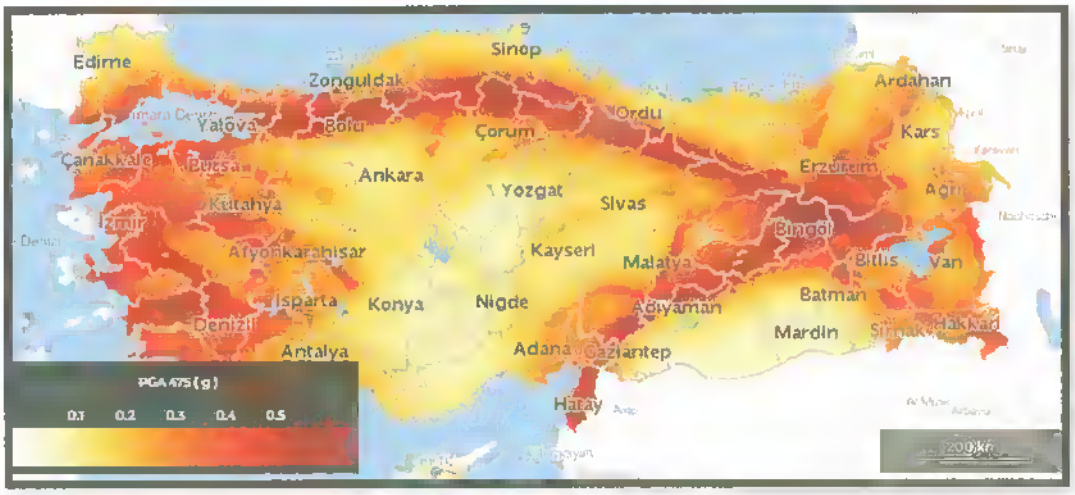
6.2 Sismik Tehlike Analizi Çalışmalarının Amacı ve İzlencesi Hakkında Kuramsal Bilgiler

Türkiye aktif tektonik hareketlerin olduğu bir bölgede bulunması nedeniyle hem bölgesel hem de sahaya özgün çalışmalarla *Deprem Tehlikesi Konusunda* araştırmalar yapılması gerekir (Şekil 6.7 - 6.9). Yapılacak çalışmanın amacı; belirli bir deprem yer hareketi düzeyi için emniyet koşulları da temel alınarak %5 sönüm oranı için spektral ivme katsayıları ile faya uzaklık ve yerel zemin özellikleri dikkate alınarak sismik tehlike analizinin yapılmasıdır.

Şekil 6.7 Türkiye Çevresine Ait Tektonik (Plaka) Hareketleri



Şekil 6.8 Türkiye Çevresinde Yer Alan Tektonik Plakaların Hareketleri Sonucu Oluşan Deprem Kaynakları (MTA Diri Fay Haritası, 2012)



Şekil 6.9 MTA 2012 Haritasından Türetilen Rejyonel Türkiye Deprem Tehlike Haritası - Tekerrür Periyodu 475 Yıllık Deprem.

Deprem (Sismik) Tehlike Analizi yapılırken karşımıza çıkan sorular ile yanıtlarının araştırılması konusundaki izlence aşağıdaki gibi tanımlanır.

- Gelecekte deprem nerede olabilir? Bu soruya yanıt aramak için diri fay haritaları kullanılır. Diri fay haritaları, deprem kaynaklarını, dolayısıyla deprem tehlikesinin nerede olacağını gösteren belge niteliğindedir.
- Gelecekte olma olasılığı olan deprem hangi büyüklükte olabilir? Bu soruya yanıt oluşturmak için diri faylar hakkında sahip olunan bilginin güvenilirliği ile doğru orantılı olarak meydana gelecek olan depremlerin büyüklüğü hakkında tahminler yapılması gerekir. Bunun için tarihsel ve aletsel dönem kayıtlarını içeren deprem katalogları kullanılır.
- Bu konudaki en önemli soru, 'Depremin ne zaman olacağıdır?' Ancak günümüze değin bu konularla ilgilenen bilim insanları henüz depremlerin kesin olarak ne zaman olacağı sorusunu yanıtlayamamaktadır. Buna karşın, fayların yakın jeolojik geçmişteki deprem davranışları dikkate alınılarak belirli bir tarih verilmeden olasılıklar dâhilinde öngörülerde bulunulabilir.
- Bu konuda diğer bir sorumuzda hangi tür mühendislik yapıları için deprem tehlikesi araştırılması yapılıyor olacaktır. Bu sorunun yanıtı bize hangi deprem seviyesinde tasarım yapacağımız konusunda ön bilgi verir. Bu konuda en önemli kriter mühendislik yapısının önemi, ekonomik ömrü ve

deprem sonrası hangi seviyede yapısal hasarların oluşmasına izin verilmesi olacaktır. Ayrıca nükleer santral ve tehlikeli atık içeren alanların ayrıca dikkate alınması gerekir.

Literatürlerde deprem riski ve tehlikesi arasında tanımlanan ilişki;

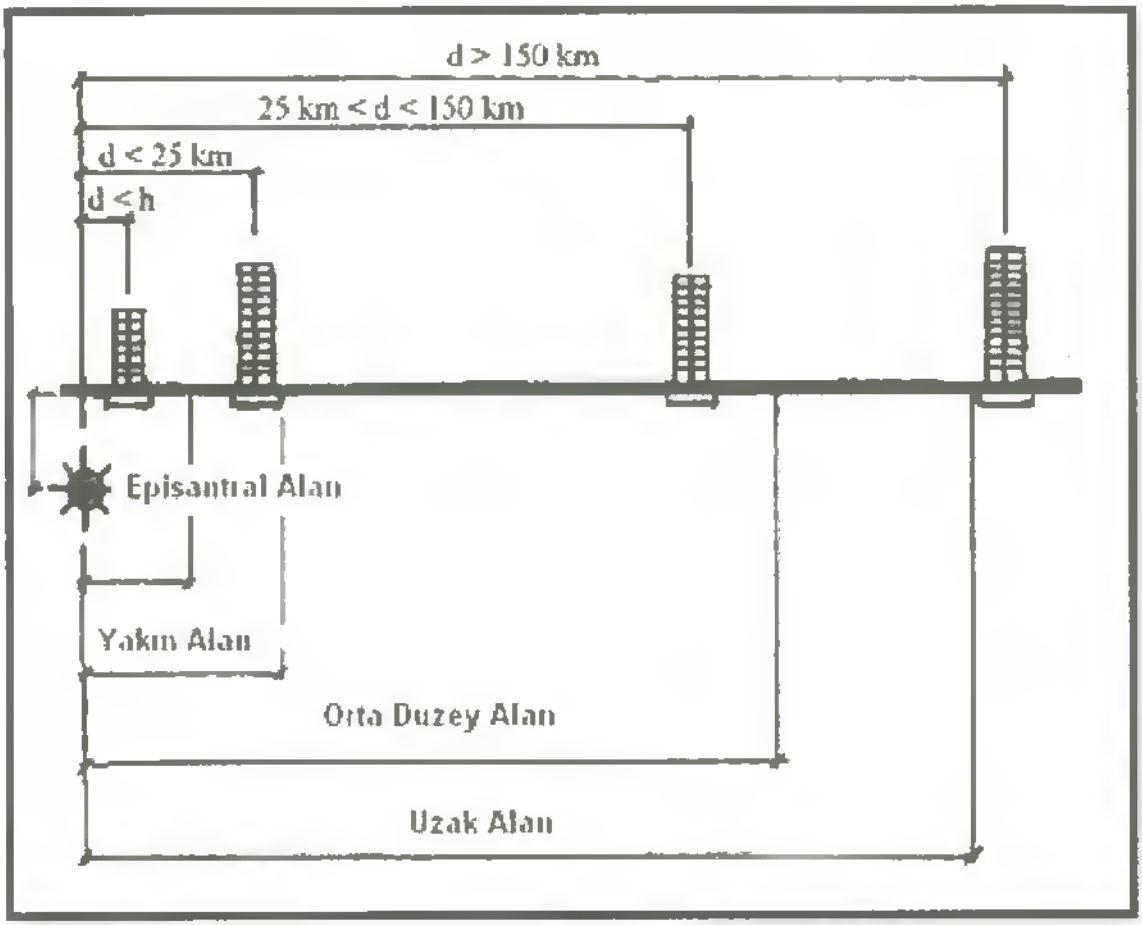
Deprem Riski= Deprem Tehlikesi x Yapısal Hasar Görebilirlik

olarak tanımlanır.

Diğer bir ifadeyle;

- Deprem tehlikesi var olmasına karşın yapısal hasar görebilirlik yoksa bu koşulda deprem riski yoktur denir.
- Deprem tehlikesi yok olmasına karşın yapısal hasar görebilirlik varsa bu koşulda da deprem riski yoktur denir.

Bu kavramlara göre, çalışmanın ilk aşamasında çalışma alanının deprem kaynaklarına ve geçmiş deprem verilerine göre konumu değerlendirilerek hangi koşullarda (standart çalışmalar veya sahaya özel çalışmalar) sismik tehlike analizinin yapılacağına karar verilir (Şekil 6.10).



Şekil 6.10 Deprem kaynağı ve etkileme alan tanımı (Gioncu ve Mazzolani, 2011)

Genel olarak araştırılan bölge için sismik tehlike analizi çalışmalarında kullanılacak yönteme karar verilirken,

- Değişik sismik kaynakların varlığı durumunda olasılıksal yaklaşım uygun görülürken,
- Bölgedeki tehlikeyi sadece tek bir kaynak düzenliyorsa deterministik yaklaşım tercih edilmektedir.

Ayrıca; sahaya özgün çalışmaların gerekli olup olmadığı farklı ulusal ve uluslararası yönetmeliklerde (Türkiye Bina Deprem Yönetmeliği 2018; ASCE-7 (Charney (2015)), AASHTO-LRFD 2010) tanımlanmıştır. 2018 Türkiye Bina Deprem Yönetmeliği'nde yerel zemin sınıfı ZF olan zeminler için sahaya özel zemin davranış

analizi yapılabileceğini; ancak proje mühendisinin tercihine bağlı olarak diğer sınıflardaki zeminlerde de bu analizin yapılabileceği belirtilmiştir.

AASHTO yönetmeliğinde ise sahaya özgün çalışma gerektiren durum aşağıda özetlenmiştir;

- Saha aktif bir faya yakınsa (6 mil = 9.66 km)
- Zemin sınıfı F ise
- Yapılacak tesisin önem katsayısı, risk sınıfı çok yüksek ise
- Bölgede uzun süreli depremler bekleniyorsa ve depreme tasarım periyodundan daha uzun süre maruz kalacağı düşünülüyorsa sahaya özgün standart koşullarda veya sahaya özel olarak yapılmasına karar verilir.

Bilindiği gibi sismik tehlike analizinde amaç eskiden olmuş deprem olaylarına ait eldeki verileri, jeolojik, sismolojik, istatistiksel ve diğer bilgilerle sistematik bir şekilde birleştirerek, ileride beklenebilecek sismik etkinlik için belirli olasılık değerlerini saptayabilmektir. Sismik tehlike analizinin sonucu, genellikle inşaat sahasındaki belirli bir zemin hareketi parametresinin veya deprem büyüklüğünün bir yıldaki aşılma olasılığını (veya ortalama tekrar süresini) gösteren bir eğri şeklindedir.

Sismik tehlike analiziyle deprem tehlikesinin niceliksel olarak ve deprem mühendisliğinde kolayca kullanılabilecek parametreler cinsinden ortaya konulması, mühendislik yapılarının sismik yükleri dikkate alarak projelendirilmeleri ile ilgili kararların rasyonel bir şekilde verilmesine olanak sağlamaktadır. Depreme dayanıklı yapı tasarımının hedefi, bina türü yapıları önem derecesini de dikkate alarak farklı yer hareketi seviyelerine göstereceği farklı performans seviyelerine dayanacak şekilde inşa etmektir. Örneğin bina türü yapılarda can güvenliği performans hedefine karşılık gelen yer hareketi seviyesi "tasarım yer hareketi" olarak tanımlanır.

Sismik tehlike analizleri; deprem sırasında zemin yüzeyinde oluşacak olan deprem-zemin-yapı davranışını ön kestirmek için tanımlanması gereken tasarım yer hareketi geliştirilmesinin önemli bir kısmını oluşturmaktadır. Bu amaçla yapılacak çalışmalarda sismik tehlikeler probabilistik (olasılıksal-OSTA) ve/veya deterministik (DSTA) yöntemler kullanılarak hesaplanabilir.

Deterministik yaklaşımda, zaman boyutundan bağımsız olarak bir bölgede meydana gelebilecek en büyük depremin yaratacağı yer hareketi seviyesi belirlenir. Deterministik yöntem kullanılarak yapılan hesaplamalarda belirli bir deprem kaynağına göre yapılacak deterministik ve/veya olasılıksal deprem tehlike çalışmaları temel alınır. Bu çalışmalar bölgenin sismik karakterini daha gerçekçi yansıtacak şekilde bölgeye özel/parsel bazlı çalışmalar olabilmektedir.

Olasılıksal yaklaşımda hasar yapıcı yer hareketinin belli bir yerde ve belli bir zaman periyodu içerisinde meydana gelebilme olasılığı araştırılır. Olasılıksal analizde depremin boyutu, yeri ve süresi ile ilgili belirsizlikler göz önüne alınır.

Sismik tehlike analizi çalışmalarında önce inceleme bölgesinde gelecekte can ve mal kayıpları oluşturmaya yönelik risk yaratabilecek tüm potansiyel sismik aktivite kaynaklarının (deprem kaynaklarının) tanımlanması ve karakterize edilmesi gerekir. Deprem kaynaklarının tanımlanması yapılırken temel alınması gereken konular tarihsel ve aletsel deprem kayıtları ile beraber jeolojik ve tektonik kanıtlardır. Jeolojik kanıtlar kapsamında yapılacak çalışmalar fay aktivitelerini kapsar. Fay hareketleri sonucu oluşabilecek magnitüd değerlerinin hesaplamalarında kullanılabilecek çok sayıda ampirik ilişki mevcuttur. Tektonik kanıtları tanımlamak için kullanılacak araştırmalarda da Levha Tektoniği ve Elastik Rebound Kuramı'na dayalı olarak biriken deformasyon enerjisine bağımlı olarak elde edilecek kanıtlar kullanılır.

Ekonomik ömürlerinin "sonsuz" kabul edilmesi gereken tehlikeli atık alanları, nükleer santraller, barajlar, hastaneler, köprüler ve yüksek binalar gibi olası bir deprem etkisi sonucunda yapısal hasar görmeleri sonucunda, büyük can kayıplarına ve/veya doğa felaketlerine yol açabilecek önemli mühendislik yapıları için dikkatli ve ayrıntılı bir sismik tehlike analizinin yapılması gerekir. Buna karşın, ekonomik ömürleri sınırlı kabul edilebilecek olağan yapıların her biri için ayrıntılı bir sismik tehlike analizinin yapılması uygulamada pratik olmayacaktır.

Bu nedenle, bu tip olağan yapıların projelendirilmesinde kullanılmak üzere bölgesel sismik tehlike haritaları (parsel bazlı olmayan, büyük bir bölgeyi tek bir tehlike sınıfına sokan haritalar) kullanılmaktadır. Bu aşamada izleyen bölümlerde parsel

bazlı (site-specific) sismik tehlike analizi konusuna açıklamalara ve kuramsal bilgiler verilmiştir.

6.2.1 Olasılıksal Sismik Tehlike Analizleri (OSTA)

Sismik tehlike, zemin hareketi veya deprem büyüklüğüne ilişkin bir parametrenin inşaat sahasındaki değerinin, öngörülen süre içinde belirli bir düzeyi aşma olasılığı olarak tanımlanmaktadır. Bu sürenin bir yıl olarak alındığı durumda bulunan (yıllık) aşılma olasılığı, yıllık sismik tehlike olarak adlandırılır. OSTA çalışmalarında deprem tehlikesi olarak yapısal hasar veren yer hareketinin belli bir yerde ve belli bir zaman periyodu içerisinde meydana gelme olasılıkları temel alınır. Yapılan çok sayıda "senaryo" varsayımı ile 100 km yarı çaplı alan için tehlike olabilecek tüm deprem büyükleri (M), yerleri (D), ve tekrarlanma sıklıklarına bağlı oluşabilecek deprem-zemin ortak davranışına ait yer hareketi parametrelerinde oluşabilecek değişim belirlenmeye çalışılır. Çalışmalar 4 aşamalı olarak yapılır. Bu aşamalar aşağıda tanımlanmıştır.

Aşama 1. Deprem kaynaklarının tanımlanması çalışmalarını kapsar. Bunun için deprem kaynaklarındaki potansiyel kırılma bölgelerinin olasılık dağılımlarının da tanımlanması gerekir. Uygulamada, her bir deprem kaynak zonu için üniform olasılık dağılımı kabul edilir yani kaynak zonundaki herhangi bir noktada deprem olma olasılığının birbirine eşit olduğu kabul edilir. Daha sonra, bu dağılımlar kaynak uzaklığı olasılık dağılımını belirlemek için kaynak geometrisi ile birleştirilir. Deterministik Sismik Tehlike Analizi (DSTA) çalışmalarında kaynak bölgesinde inceleme alanına en yakın noktanın deprem olma olasılığının 1, diğer noktalarda olma olasılığının 0 olduğu kabul edilir.

Aşama 2. Bu aşamada her bir deprem kaynak zonundaki depremlerin büyüklüğüne ait belirsizliğin, deprem yinelenme ilişkileri ile tanımlanması gerekir.

Aşama 3. Sismik tehlike analizinde yer hareketindeki değişim yer hareketi tahmin ilişkileri (ground motion prediction equations - GMPEs) kullanılarak yapılır. Bölgeyi ilgilendiren her bir noktada farklı kaynaklar tarafından olası büyüklüklerdeki depremler tarafından üretilen yer hareketi bu ilişkiler kullanılarak belirlenir. Olasılıksal Sismik Tehlike Analizi (OSTA) çerçevesi içinde azalım ilişkileri kullanılırken bölgeye uygun GMPE'lerin kullanımı son derece önemlidir. Bölgeye

temsil ettiği düşünülen GMPE'ler seçilirken karşılaşılan epistemik belirsizlik mutlaka dikkate alınmalıdır.

Bu epistemik belirsizliklerin azaltılması için farklı GMPE'ler (birden fazla) analize dahil edilebilir. Ancak bunu yaparken de mümkün olduğunca az, ancak yeterli sayıda GMPE'lerin kullanılması gerekmektedir. GMPE'ler kullanılırken ilgili parsel için hâkim zemin sınıfı da dikkate alınabilir (belli bir zemin sınıfı için yer hareketinin – pik/maksimum değerinin tahmini) gerçekleştirilebilir. Böylece yerel zemin sınıfının etkisi de tehlike analizine dahil edilmiş olur.

Aşama 4. Depremin yeri, boyutu ve tahmin (azalım) ilişkilerindeki belirsizliklerin birleştirilerek, belirli bir zaman aralığındaki aşılma olasılıkları cinsinden yer hareketi parametresinin belirlenmesi çalışmaları yapılır.

6.2.2. Deterministik Sismik Tehlike Analizleri (DSTA)

DSTA belirli bir kaynağın, belirli bir boyutta ve belirli bir yerde yaratacağı depremin oluşturduğu yer hareketinin tahmin edilmesi işlemidir. Uygulamada, DSTA çalışmaları yapılırken, her bir kaynak zonundaki olası en büyük magnitüdlü depremin olası en kısa uzaklıkta olacağı varsayımı kullanılır. Bu kapsamda yapılacak ideal bir deterministik sismik tehlike analizi çalışmaları içeriğinde, OSTA çalışmalarında olduğu gibi 4 aşamalı bir işlem uygulanır.

Aşama 1. Deprem kaynak tanımlaması yapılır. Bu çalışma içeriğinde deprem kaynaklarının, kaynak geometrisi ve deprem potansiyeli olarak tanımlanması gerçekleştirilir.

Aşama 2. Her bir deprem kaynak zonu için uzaklık parametrelerinin seçilmesi sağlanır. Çoğu DSTA'de, deprem kaynağı ile inceleme alanı arasındaki en kısa uzaklık seçilir. Hangi tür uzaklığın kullanılacağının ise bir sonraki aşamada kullanılacak olan azalım ilişkisine göre belirlenmesi gerekir.

Aşama 3. En yüksek seviyedeki yer hareketini üretmesi beklenen deprem kaynağının seçimi yapılır. Bu seçilen kontrol depremi inceleme bölgesindeki yer hareketi parametreleri cinsinden açıklanır. 1. adımda tanımlanmış olan depremlerin, 2. adımda belirlenmiş olan uzaklıklar için inceleme alanında ürettikleri yer hareketi seviyesi, seçilen parametreler cinsinden azalım ilişkilerine dayalı olarak belirlenir.

Aşama 4. Sismik tehlikeyi oluşturacak depreminin ruhsat alanında üreteceği deprem-zemin yapı ortak hareketi parametrelerinin tanımlanması yapılır. Sismik tehlikeyi tanımlamak için yaygın olarak kullanılan parametreler, pik yer ivmesi, yer hızı ve yerdeğiştirme değerleridir; bunların yanında deprem tepki spektrumu ve davranış spektrumu parametreleri de vardır.

6.2.3. Deprem Magnitüd Değerleri İle Tekrarlanma Frekansları Arasındaki Bağıntı

Deprem kaynaklarının olası depremsel etkinliklerini belirleyebilmek için o kaynaklara ait yineleme ilişkilerinin bilinmesi gerekir.

Bunun anlamı, magnitüd ile frekans arasında ilişki olduğu varsayımından yola çıkılır.

Bu konuda Gutenberg ve Richter (1944) tarafından magnitüd ile frekans arasında lineer bir ilişkinin olduğu ve bunun da

$$\text{Log } N(M) = a + b\,M \qquad (6.1)$$

bağıntısı ile tanımlanabileceği belirtilmiştir. Geçmiş deprem kaynaklarına ait a ve b regresyon sabitleri bu deprem kaynaklarında oluşan magnitüdü MW ≥ 4 olan depremlerin kümülatif sayıları bulunarak. "En Küçük Kareler Yöntemiyle" hesaplanarak deprem kaynağına ait önce magnitüd-frekans denklemi daha sonra da bu veriler normalize edilerek a ve b değerleri hesaplanır. Her kaynak için Log N(M) = a + bM ile tanımlanan doğrusal ilişki olduğu kabul edilir. "Her kaynak için ayrı ayrı hesaplanan regresyon katsayılarının (a, b) güvenilirlikleri eldeki verilerin miktarına ve kalitesine bağlıdır.

Genel olarak deprem sayısının çok olduğu kaynaklar için a ve b'nin varyasyon katsayıları daha düşük, deprem sayısının daha az olduğu kaynaklar için ise daha yüksektir. a katsayısı, magnitüdü belirli bir değerden büyük depremlerin sayısını, b ise sismik etkinliğin seviyesini göstermektedir. b'nin negatif değeri küçüldükçe etkinlik artmaktadır (Gülkan vd., 1976).

6.2.4. Baraj Türü Mühendislik Yapıları İçin Tasarım Depremi Kavramı Esasları

Uluslararası Büyük Barajlar komisyonu (ICOLD) barajların sismik tasarımı için İşletme Bazlı Deprem (OBE), Maksimum Tasarım Depremi (MDE) ve Olabilecek En

Büyük Deprem (MCE) kavramlarını ortaya atmıştır. Söz konusu kavramlar izleyen alt başlıklarda açıklanmaktadır (ICOLD, 1989).

- **Tasarım Depremi (MDE/SEE):** Maksimum Tasarım Depremi, her türlü yapının tasarımına baz olan depremdir ve yıkılması durumunda yaşamsal veya çok büyük ekonomik kayıplara yol açabilecek yapılar durumunda deterministik olarak olabilecek en büyük deprem, MCE'ye eşit deprem düzeyi olarak alınabileceği gibi çok yüksek dönüş süreleri göz önüne alınarak probabilistik olarak da belirlenebilir. Normal bir mühendislik yapısı bu şiddette bir depremin etkisine maruz kaldığı zaman önemli hasar görse bile ayakta kalabilecektir. Bu baraj tipi bir mühendislik yapısı ise en azından su rezervuar kapasitesi korunabilecektir. Bu deprem seviyesi ile Türkiye Bina Deprem Yönetmeliği (2018) içeriğinde tanımlanan deprem düzeyleri arasında ilişki kurulursa; bu seviye DD-2 Deprem Yer Hareketine karşılık gelir. Diğer bir tanımla, spektral büyüklüklerin 50 yılda aşılma olasılığı %10 ve buna karşı gelen tekrarlanma periyodu 475 yıl olan çok seyrek deprem yer hareketini nitelemektedir.

- **İşletmeye Esas Tasarım Depremi (OBE):** OBE kavramı mühendislik yapısı üzerinde yalnızca çok küçük hasarlar yaratabilecek bir yer hareketi seviyesini tarif eder. Mühendislik yapısı, yardımcı yapılar ve ekipmanlar işlevlerini OBE seviyesinde bir deprem sonrasında da sürdürebilecektir. Normal mühendislik yapıları için OBE değerine yakın fakat onu aşmayan depremlerin oluşması halinde hasar ya hiç oluşmayacak ya da oluşan hasar kolaylıkla işletmeyi aksatmayacak şekilde giderilebilecektir. Diğer bir ifade ile OBE 50 yıllık bir periyot içerisinde %50 aşılma olasılığına karşılık gelen yer hareketini tanımlar. Böyle bir hareketin geri dönüş periyodu ise 72 yıla karşılık gelmektedir. Türkiye Bina Deprem Yönetmeliği (2018) içeriğinde DD-3 Deprem Yer Hareketi olarak tanımlanmıştır. Ancak, mevzu bahis yapı önemli bir yapı olduğu için yapısal tasarım ile bu deprem seviyesinde atık depolama tesisinde herhangi bir hasarın meydana gelmemesi için gerekli önlemlerin alınması gerekmektedir.

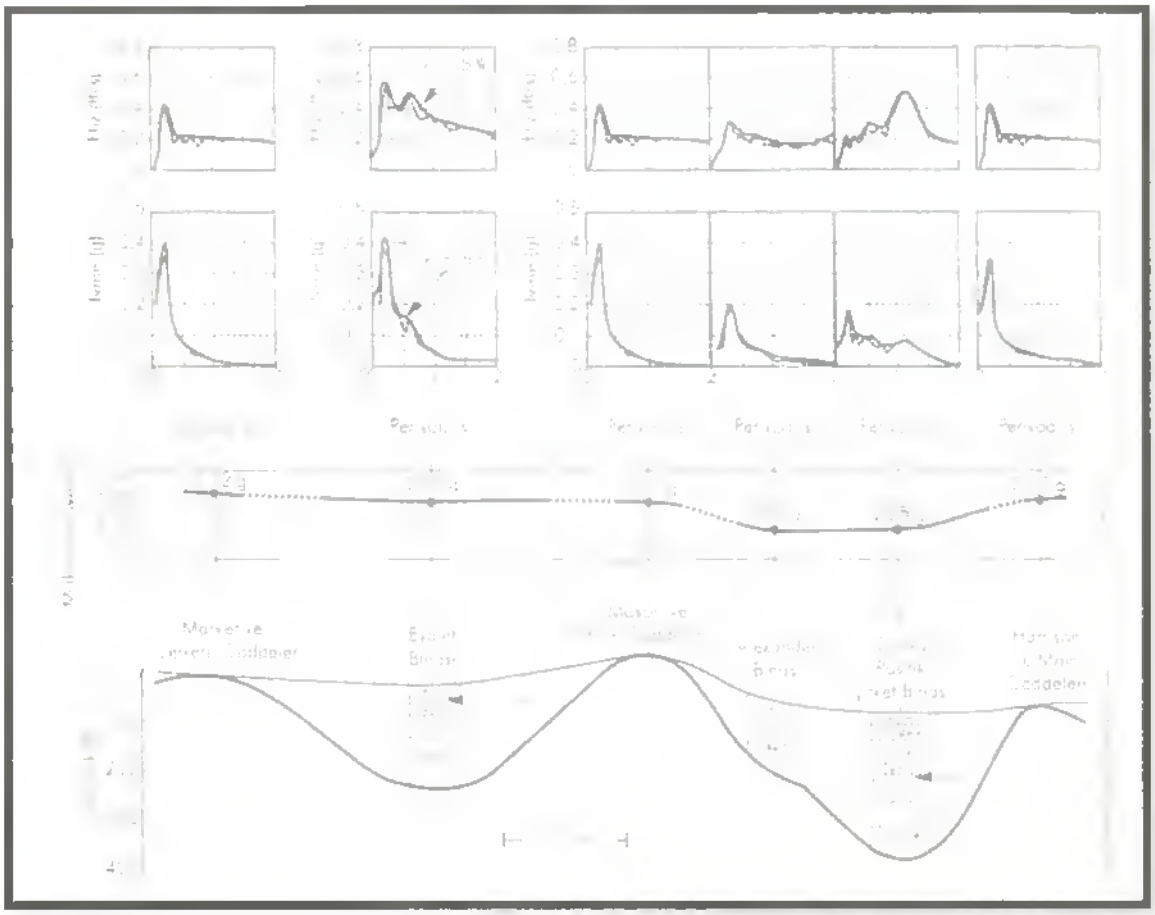
- **Oluşabilecek En Büyük Tasarım Depremi (MCE):** Bu kavram sismotektonik bölge veya fay zonu üzerinde oluşması muhtemel en büyük depremi tarif eder. Meydana gelme olasılığının önemi yoktur, zira bu deprem 100 yıl ile 10 000 yıllık çok geniş bir periyotta oluşabilir. Mühendislik yapıları kapsamında bu değer 2475 yıla karşılık gelmektedir. Türkiye Bina Deprem Yönetmeliği (2018) içeriğinde DD-1 Deprem Yer Hareketi olarak tanımlanmıştır. Bu deprem seviyesi altında, mühendislik yapısında hasar meydana gelebilir; ancak bu hasarın kesinlikle göçme seviyesinde olmaması gerekmektedir; çünkü göçme sonucu çevresel ve yaşamsal çok ciddi sonuçların olabileceği varsayımı kullanılır. Bu deprem seviyesine uygun olması gereken mühendislik yapı tasarımı bu hedefi sağlayacak şekilde yapılmalıdır.

6.3. Ruhsat Alanında Yapılan Sismik Tehlike Analizi Çalışmalarının İzlencesi

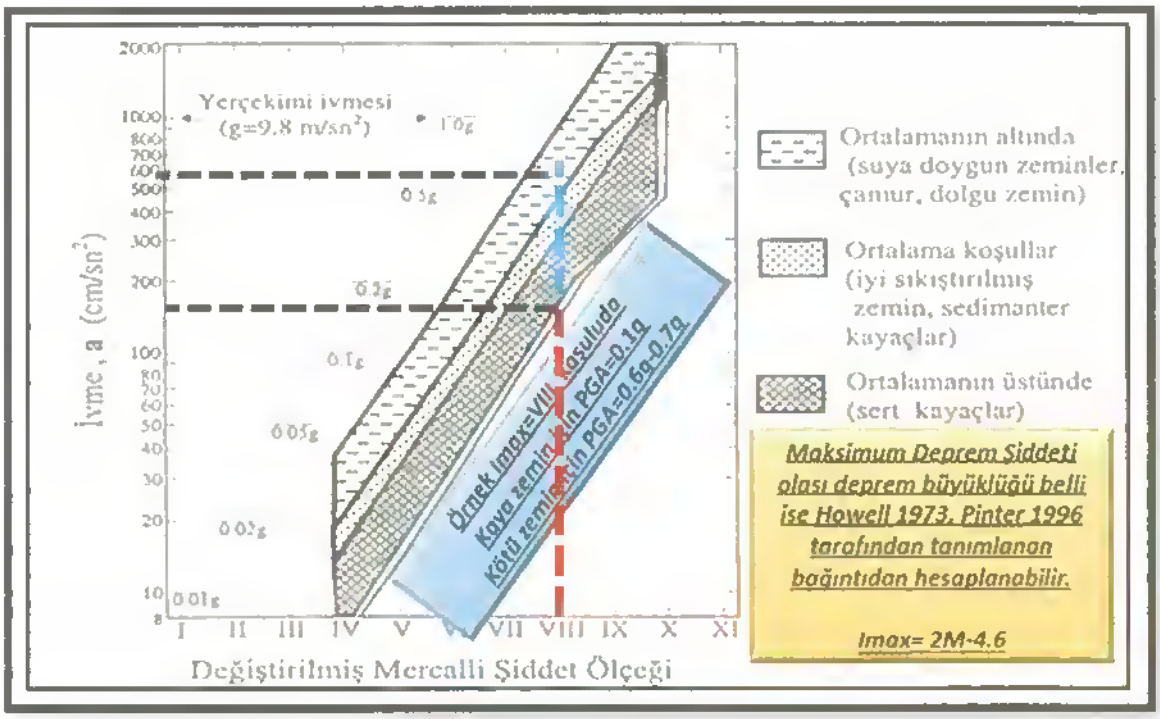
Ruhsat alanında yapılan yüzey arazi gözlemleri ve ölçümleri sonucunda sismik tehlike analizi kapsamında yapılacak çalışmalarda yerel zemin özelliklerinin dikkate alınması gerektiği saptanmıştır. Yüzey jeolojik gözlemleri sonucunda ruhsat alanının homojen bir yapıda (kırıklı, çatlaklı ve ayrışmaya uygun) olmadığı ve zemin özelliklerinin küçük ölçeklerde bile değişebileceği saptanmıştır. Bu konuda literatür örneği Şekil 6.11'de verilmiştir. Şekil 6.11'de, zemin anakaya yapısının ve zemin özelliklerinin zemin yüzeyindeki PGA değerlerinde küçük ölçeklerde bile değişim yaratabileceği vurgulanmaktadır.

Ruhsat alanında yüzeyde gözlenen jeolojik özellikler (kırıklı, çatlaklı ve ayrışmaya uygun) nedeniyle deprem sırasında oluşan zemin hareketlerinin yerel zemin özelliklerinden etkilenmesi sonucunda kuvvetli yer hareketinin en önemli karakteristikleri olan güçlü yer hareketi süresi ve zaman ortamındaki genlik değerleri ile spektrumdaki genlik ve periyot değerlerinin yüksek oranlarda etkilenme olasılığı vardır. Bu etkilerin araştırılması için sahaya özgün zemin, mühendislik anakaya ve sismik anakaya tanımlarının sismik S dalga hızı değerlerine göre yapılması gerekir (Nath, 2007 ve Şekil 6.1). Günümüze değin yapılan çalışmalar göstermiştir ki (Kramer, 1996), zemin yüzeyindeki deprem davranışının zaman ve frekans ortamı parametrelerinin etkilenme dereceleri, anakaya derinliğine, anakaya üst yüzey topoğrafyasına, zemin tabakalar arasındaki sismik empedans oran değişimlerine,

mühendislik anakayası üzerinde bulunan zemin katmanlarının malzeme özelliklerine, tabakaların kalınlık ve derinlikleri ile yatay ve düşey yöndeki sürekliliklerine (geometrisine) göre aşırı oranda değişir (Şekil 6.11 ve 6.12).



Şekil 6.11 1957 San Francisco, M=5.3 Depreminde Elde Edilen PGA Değerleri. Şekilde verilen, 1957 yılında San Francisco'da olan M=5.3 depreminde farklı bölgelerden elde edilmiş zemin davranış kayıtları üzerindeki zemin etkisine en çarpıcı örnek olarak verilebilir.



Şekil 6.12 Değiştirilmiş Mercalli Şiddet Çetveli Ölçeği, Zemin Tipi, İvme ve Deprem Şiddeti Arasındaki İlişki (Pinter (1996)'dan alınmıştır). Bu şekil depremin yapısal hasarlar üzerindeki etkisini tanımlayan deprem şiddeti, PGA değeri ve zemin özellikleri arasındaki ilişkinin ne kadar önemli olduğunu açıklamaktadır.

Ayrıca tasarımda kullanılacak deprem seviyelerine karar vermek için ruhsat alanına yapılacak mühendislik yapılarının kendi içinde de kullanım amaçları dikkate alınarak risk sınıflaması kapsamında tanımlanması gerekir.

T.C. Başbakanlık Afet ve Acil Durum Yönetimi Başkanlığı (AFAD) kurumu tarafından basın yoluyla tanımı yapılan Türkiye Bina Deprem Yönetmeliği (2018) kapsamında https://tdth.afad.gov.tr/ adresinde kamuoyunun kullanımına açılan Türkiye Deprem Tehlike Haritası da bulunmaktadır. Bu harita kapsamında, sismik tehlike ve risk analizi çalışmaları deprem etkisi altında yeni binaların tasarımında ve mevcut binaların değerlendirilmesinde esas alınacak deprem yer hareketi düzeyleri 4 seviye olarak belirlenmekte ve bu hareket düzeylerine esas deprem tehlikesini ise koordinat tabanlı Türkiye Deprem Tehlikesi Haritası kullanılarak tariflemektedir.

Yapılan çalışmalarda bu konu da dikkate alınmış ve sadece bilgilendirme amaçlı ruhsat alanı için farklı deprem seviyeleri için zemin cinsleri dikkate alınmadan (Bu haritada Vs >760m/sn koşulu için hesaplamalar yapılmıştır) Türkiye Bina Deprem

Yönetmeliği (2018) kapsamında bölgesel sismik tehlike ve risk hesaplamaları yapılmış ve sonuçlar Şekil 6.13'te örnek olması amacıyla verilmiştir.

Ruhsat alanı, Havran-Balya Fay Zonu'nun 11 km uzağında bulunmaktadır. Ruhsat alanı genel özellikleri ve yapılacak yapıların risk sınıfları dikkate alındığında SAHAYA ÖZEL DEPREM YER HAREKETİ SPEKTRUMU hazırlanması gereken bölge özelliği taşımaktadır (Tablo 4.1, Şekil 3.1, 6.13 ve 6.15). Ruhsat alanının sahip olduğu jeolojik, tektonik, hidrojeolojik, zemin ve sismolojik özellikleri aşağıda tekrar özetlenmiştir.

Bu özellikler;

- Tarihsel ve aletsel dönemlerde çok büyük yapısal hasarlara neden olmuş deprem kaynaklarına yakın olması (Şekil 3.1 ve 4.1),
- Bu kaynakların diri fay özelliğine sahip olması (Şekil 6.14 ve 6.15).
- Ruhsat alanı içinde çok sayıda fay yapılarının gözlenmesi (Şekil 2.1)
- Ruhsat alanı ve çevresinin hidrojeolojik olarak yerleşim alanları için Havza kenarı özelliğinde olması (Şekil 1.1 ve 1.2),
- Ruhsat alanı yakınında köy bazında da olsa yerleşim alanlarının olması (Şekil 1.1 ve 1.2).

6.3.1. Sahaya Özgü Sismik Tehlike Analizi Çalışmaları İle Elde Edilen Çıktılar

Ruhsat alanı ve yakın çevresinin sahip olduğu tektonik, jeolojik, hidrojeolojik, sismolojik ve zemin özellikleri ile yapılacak mühendislik yapı riskleri dikkate alınarak sahaya özgü sismik tehlike analizi çalışmalarının yapılması gerektiğine karar verilmiştir.

Bu çalışma kapsamında yapılan ***sahaya özgü sismik tehlike analizi*** çalışmalarının aşamaları aşağıda ayrıntılı olarak tanımlanmıştır.

Aşama 1. Önce proje alanlarında sismik anakaya ile zemin yüzeyinde kalan ortamın deprem hareketi spektrumunu değiştirme özelliklerinin sahaya özgün tanımlanması için gözlemsel zemin transfer spektrum hesaplamaları yapılmıştır. Ayrıca yerel

zemin tiplerinin tanımlanması için Vs30 hız değerleri de hesaplanmıştır. Mikrotremor ölçüm noktalarının yeri ve sayısı nihai hali sahada ölçüm anında yapılacak değerlendirme (saha/hava/zemin koşulları vb. kıstaslar dikkate alınarak) ile optimum koşulların sağlanması sonucunda gerçekleştirilmiştir. Sahada yapılan gözlemler sonucunda 10 noktada yapılması planlanan mikrotremor ölçümleri Altınordu yetkilileri tarafından getirilen öneri doğrultusunda toplam 14 noktada gerçekleştirilmiştir. Ruhsat alanı genelinde 14 farklı noktada tek istasyon, 3 bileşen ve geniş bant özellikli mikrotremor ölçümleri (Nakamura (1989) yapılmıştır. Çalışma sonucunda her ölçüm noktası için gözlemsel zemin transfer spektrum grafikleri ile Vs30 hız değerleri hesaplanmıştır (Bignardi vd. 2016) (Tablo 6.1).

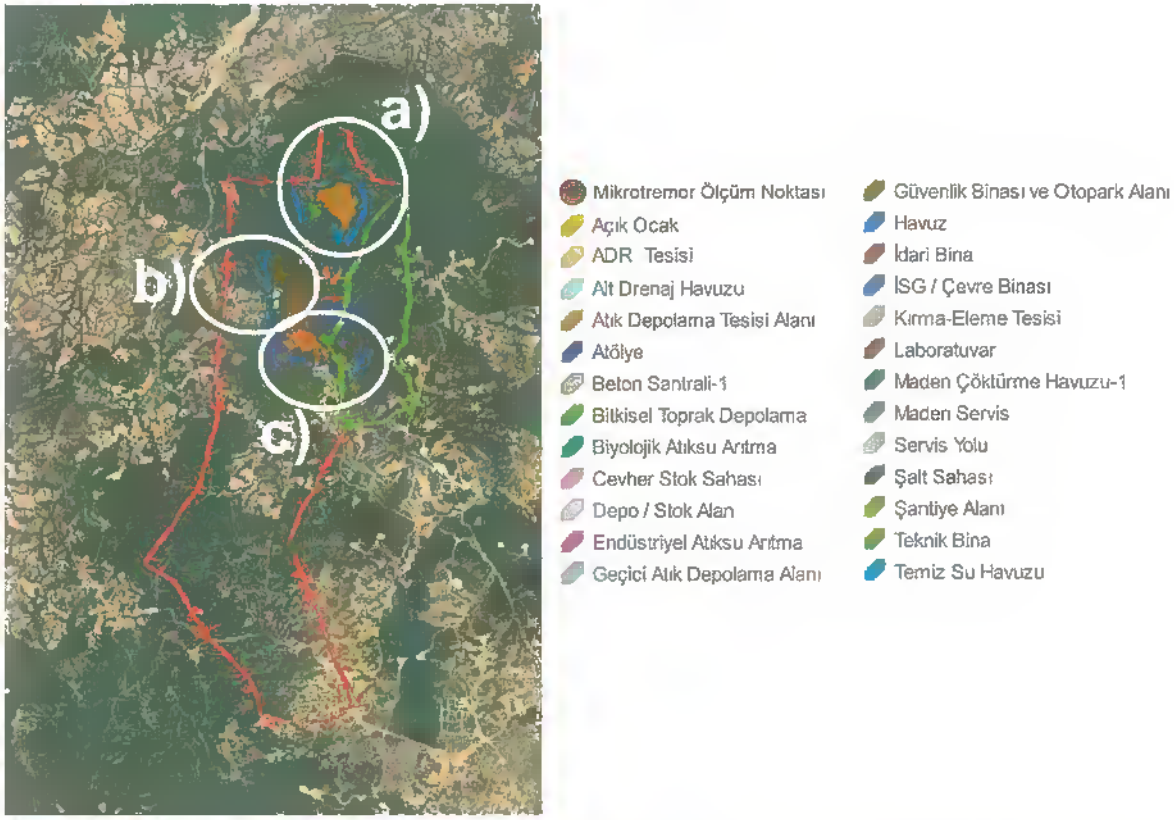
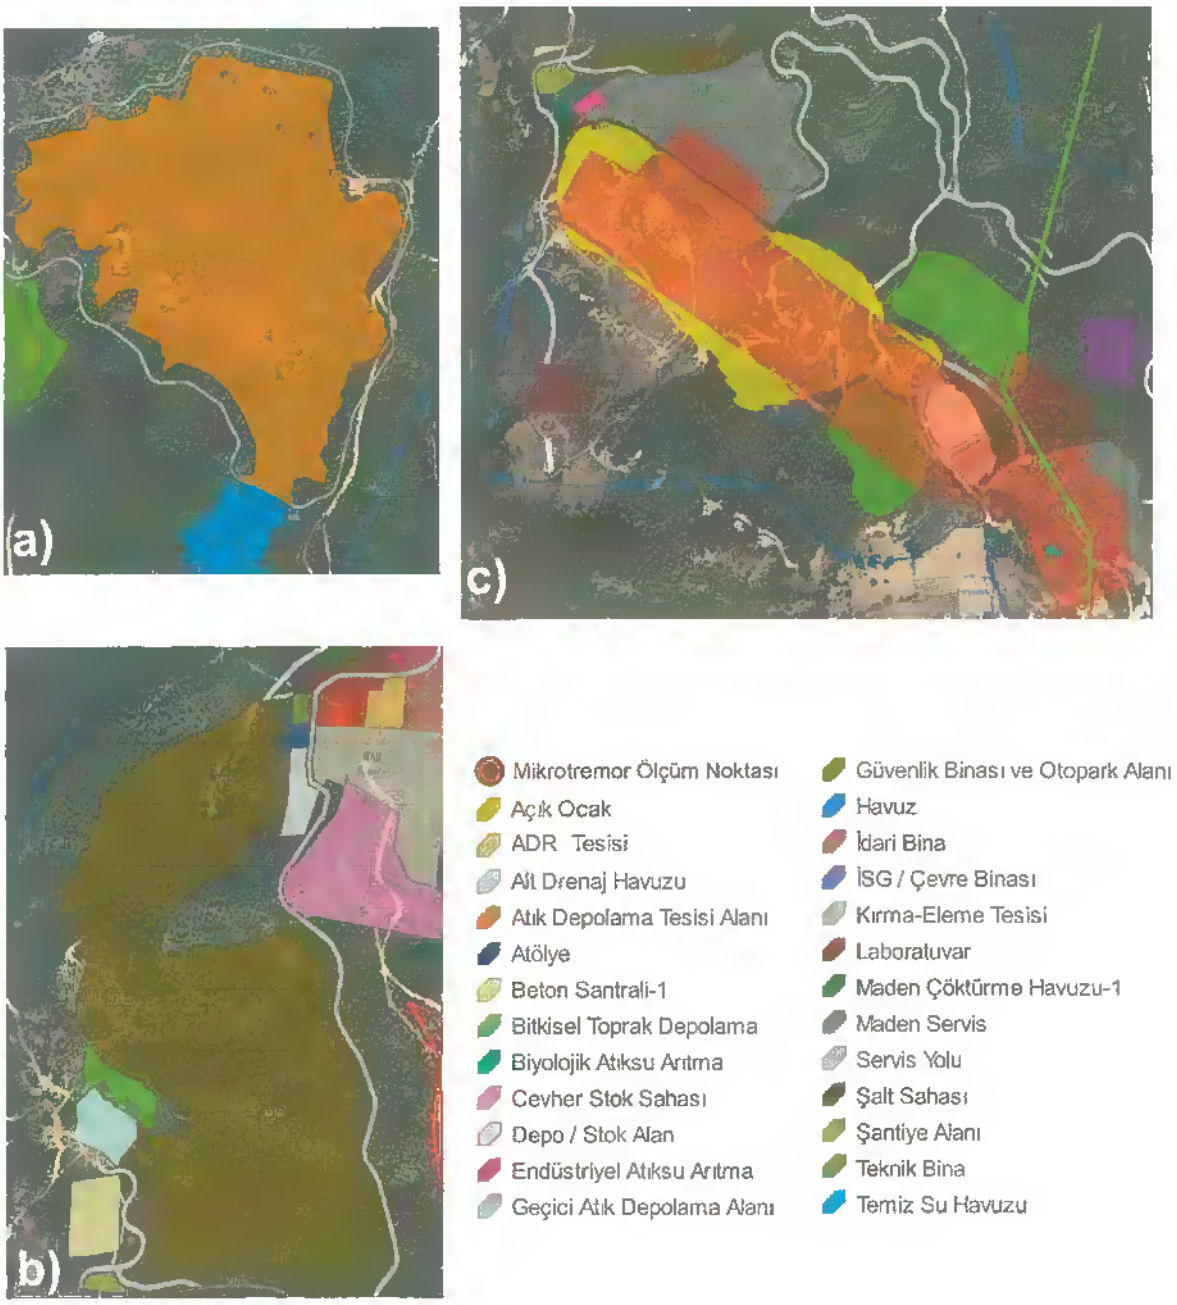
Tablo 6.2. Türkiye Bina Deprem Yönetmeliği (2018) Zemin Sınıflaması

Yerel Zemin Sınıfı	Zemin Cinsi	Üst 30 metrede ortalama		
		$(V_S)_{30}$ [m/s]	$(N_{60})_{30}$ [darbe/30 cm]	$(c_u)_{30}$ [kPa]
ZA	Sağlam, sert kayalar	> 1500	–	–
ZB	Az ayrışmış, orta sağlam kayalar	760 – 1500	–	–
ZC	Çok sıkı kum, çakıl ve sert kil tabakaları veya ayrışmış, çok çatlaklı zayıf kayalar	360 – 760	> 50	> 250
ZD	Orta sıkı – sıkı kum, çakıl veya çok katı kil tabakaları	180 – 360	15 – 50	70 – 250
ZE	Gevşek kum, çakıl veya yumuşak – katı kil tabakaları veya PI > 20 ve w > %40 koşullarını sağlayan toplamda 3 metreden daha kalın yumuşak kil tabakası (c_u < 25 kPa) içeren profiller	< 180	< 15	< 70
ZF	Sahaya özel araştırma ve değerlendirme gerektiren zeminler: 1) Deprem etkisi altında çökme ve potansiyel göçme riskine sahip zeminler (sıvılaşabilir zeminler, yüksek derecede hassas killer, göçebilir zayıf çimentolu zeminler vb). 2) Toplam kalınlığı 3 metreden fazla turba ve/veya organik içeriği yüksek killer. 3) Toplam kalınlığı 8 metreden fazla olan yüksek plastisiteli (PI > 50) killer. 4) Çok kalın (> 35 m) yumuşak veya orta katı killer.			



Şekil 6.16 Proje Alanlarının Ruhsat Alanındaki Genel Konumu ve Mikrotremor Ölçüm Noktaları



Şekil 6.17 Proje Alanlarının Ruhsat Alanındaki Genel Konumu ve Mikrotremor Ölçüm Noktaları

Aşama 2: DD-1 (Maksimum Tasarım Depremi/PGA 2475), DD-2 (Tasarım Depremi/PGA 475) ve DD-3 (İşletmeye Esas Tasarım Depremi) deprem seviyeleri kullanılarak sahaya özgün değerlendirme yapmak için, Havran-Balya Fay Zonu ve Vs30 hız değerleri ile yeni nesil ivme azalım ilişkilerinin Graizer ve Kalkan (2016) çalışmasında kullanılması ile her bir ölçüm noktası için T =0 sn değerine karşılık gelen PGA değerleri hesaplanmıştır (Tablo 5.3). Ayrıca DD-1, DD-2 ve DD-3 deprem seviyeleri için %5 sönüm oranı kullanılarak hesaplanan pseudo-ivme tepki spektrumu (pseudo-spectral acceleration response spectrum) grafikleri Şekil 6.33-6.77 arasında verilmiştir.

Tablo 6.3 ve Şekil 6.18- 6.62'de verilen veriler değerlendirildiğinde elde edilen sonuçlar;

DD-1 (MCE olarak değerlendirilebilir) deprem seviyesi için (50 yılda aşılma olasılığı %2 ve tekrarlama periyodu 2475 yıl olan deprem)

- T = 0 sn periyodundaki değerler (PGA) 0.47g-0.53g arasında değişirken
- Maksimum PSA değerleri de 1.15 g-1.3g (~0.42s.-0.55s.) arasında değişmektedir.

DD-2 (MDE olarak değerlendirilebilir) deprem seviyesi için (50 yılda aşılma olasılığı %10 ve tekrarlama periyodu 475 yıl olan deprem)

- T=0 sn periyodundaki değerler (PGA) 0.39g-0.45g arasında değişim göstermektedir.
- Maksimum PSA değerleri de 0.55g-1.08g (~0.28s- 0.36sn) arasında değişmektedir.

DD-3 (OBE olarak değerlendirilebilir) deprem seviyesi için (50 yılda aşılma olasılığı %50 olan deprem)

- T=0 sn periyodundaki değerler (PGA) 0.39g-0.44g arasında değişim göstermektedir.

- Maksimum PSA değerleri de 0.93g-1.05g (~0.18 s- 0.24sn) arasında değişmektedir.

Tablo 6.3. Ruhsat Sahasında Yapılan Her Bir Ölçüm Noktası İçin Vs30 Hız Değerleri, Yeni Nesil İvme Azalım İlişkileri, Fay Tipi ve Kalite Faktörü Kullanılarak Graizer ve Kalkan (2016) "Summary of GK15 Ground-Motion Çalışması ile DD-1, DD-2 ve DD-3 Deprem seviyeleri için hesaplanan PGA (T=0s) Değerleri Tablosu.

Hesaplamalarda proje alanına en yakın sismik kaynak olarak tanımlanan Havran-Balya Fay Zonu için kullanılan deprem parametreleri aşağıdaki gibidir.

Proje alanına kaynak uzaklığı = 11 km,

DD-1 deprem seviyesi için Mw =9.6

DD-2 deprem seviyesi için Mw =8.5

DD-3 deprem seviyesi için Mw = 7.4

6.3.2. Standart Koşullarda (Bölgesel) Yapılan Sismik Tehlike Analizi Çalışmaları ve Elde Edilen Çıktılar

6.3.2.1 Türkiye Bina Deprem Yönetmeliği (TBDY-2018) Dikkate alınarak Bulunan Değerler

Proje alanı için Türkiye Bina Deprem Yönetmeliği (TBDY-2018) ve bu kapsamda hazırlanan Türkiye Deprem Tehlike Haritası geniş kapsamda değerlendirilerek ZA,ZB, ZC zemin sınıfları ile DD-1, DD-2 ve DD-3 deprem seviyelerinin ayrıntılı sonuçları aşağıda tanımlanmıştır.

ZA Zemin Sınıfı için;

- DD-1 seviyesi için zemin cinsinden bağımsız PGA=0.650g olarak hesaplanmıştır.
- DD-2 seviyesi için zemin cinsinden bağımsız PGA=0.347g olarak hesaplanmıştır.
- DD-3 seviyesi için zemin cinsinden bağımsız PGA=0.137g olarak hesaplanmıştır.

ZB Zemin Sınıfı için;

- DD-1 seviyesi PGA= 0.650 g
- DD-2 seviyesi PGA= 0.347 g
- DD-3 seviyesi PGA= 0.137 g

ZC Zemin Sınıfı için;

- DD-1 seviyesi PGA= 0.650 g
- DD-2 seviyesi PGA= 0.347 g
- DD-3 seviyesi PGA= 0.137 g

olarak vermektedir. Bu değerler irdelendiğinde zemin sınıfı değişimlerinin Türkiye Deprem Tehlike haritası kullanılarak yapılacak hesaplamalarda etkisinin olmadığı açıkça gözlenmektedir. Bu durum sahaya özgün olarak bu hesaplamaların yapılmasının önemini göstermektedir.

6.3.2.2. Standart Koşullarda Yapılan Deterministik ve Olasılıksal Sismik Tehlike Analizi Çalışmaları

Standart koşullarda yapılan çalışmanın önce olasılıksal ve deterministik tehlike analizleri zemin etkisi dikkate alınmadan yapılmıştır. Daha sonra da zemin etkisi Vs30 hız değerleri ile hesaplamalara dâhil edilmiştir.

İlk aşamada, zemin özelliklerini dikkate almadan bölgesel olarak yapılacak sismik tehlike analizi çalışmaları ile sismik anakaya seviyesine ait PGA değerlerinin hesaplanması çalışmaları yapıldı. Bunun için proje alanı ve yakın çevresinin (100 km yarıçap içinde kalan alan için) bölgesel olarak deprem tehlikesi yönünden tanımlanması çalışmasında kullanılması gereken veriler toplandı ve sonuçlar elde edildi.

Bir bölgede gelecekte büyük bir depremin magnitüdünü, yerini ve yer hareketinin ivmesini ve tekrarlanma ilişkisini olasılık analizi yaparak tahmin edebilmek için beş konuda bilgi sahibi olunmalıdır.

Konu 1 ve Konu 2 Sismotektonik ile Bölgenin jeolojik ve tektonik durumu: önemli yer hareketi oluşturabilecek tüm deprem kaynaklarının tespit edilmesi ve bölgeyi etkisi altına alabilecek depremlerin noktasal, çizgisel veya alansal nitelikte olabilen kaynaklardan hangisine ait olduğunun belirlenmesi

Konu 3 Deprem tekrarlanmasının zamansal dağılımı ortaya konur: Belirli bir deprem büyüklüğünün aşılacağı ortalama oranı tanımlayan tekrarlanma ilişkisidir. Bu çalışma için 4 'ten daha küçük magnitüdlü depremlerin sismik tehlikeye katkısı olmadığı varsayılmıştır. Tekrarlanma ilişkisi ile maksimum büyüklükteki deprem belirlenebilir.

Konu 4 Kaynak alanının herhangi bir noktasında oluşabilecek herhangi büyüklükteki depremin sismotektonik alanda üreteceği yer hareketi azalım ilişkileri kullanılarak belirlenmelidir.

Konu 5 Deprem kaynak parametreleri olan deprem lokasyonu, deprem büyüklüğü ve yer hareketinin kestirilmesi ile ilgili belirsizlikler birleştirilerek, belirli bir zaman aralığında yer hareketi parametresinin aşılma ihtimali elde edilir (Kramer, 2003). Bu kavramlara göre yapılan sismik tehlike analizi çalışmaları aşağıda tanımlanmıştır.

- **Deterministik Sismik Tehlike Analizi (DSTA)** çalışmaları ruhsat alanı merkez olmak üzere 100 km yarıçap içerisindeki bütün olası deprem kaynakları (diri faylar) tanımlanmıştır. Bu fayların geometrik özellikleri de dikkate alınarak Wells ve Coopersmith (1994) tarafından tanımlanan bağıntılarla fay uzunluğu-Magnitüd ilişkisi kurularak hesaplamalar yapılmıştır.

- **Olasılıksal Deprem Tehlike Analizi Çalışmaları ve Sonuçları;** Ruhsat alanı merkez alınarak ortalama 100 km yarıçaplı alan içinde kalan aletsel dönemlere ait deprem verilerinin elde edilmiştir (Şekil 6.11 ve Tablo 6.4).

Tablo 6.4 Kandilli Rasathanesi Deprem Kataloğundan 125 Yıl İçin Derlenen M>=4 Olan 309 Adet Kuvvetli Yer Hareketi Verisi.

Yukarıdaki değerlere göre 50 yılda ve aşılma olasılıkları %2, %10 ve %50 hesaplamaları için ruhsat alanına en yakın sismik kaynak olarak Havran-Balya Fay Zonu dikkate alınarak hesaplamalar yapılmıştır.

Daha sonra geçmiş depremlerin tekrarlama frekanslarının belirlenerek (Tablo 6.5) Log(N)=a-b*M Gutenberg&Richter bağıntısından **a= 3,207357064 ve b= -0,689008883** olarak hesaplanmıştır.

Tablo 5.5 Ruhsat alanı merkez olacak şekilde 100 km yarıçapındaki sismotektonik bölgede magnitüd, oluş sayısı.

Büyüklük (M) Aralıkları	4.0 ≤ M <4.5	4.5 ≤ M <5.0	5.0 ≤ M < 5.5	5.5 ≤ M <6.0	6.0 ≤ M <6.5	6.5 ≤ M <7.0	7.0 ≤ M <7.5	7.5 ≤ M <8.0
Ni (Oluşum Sayıları)	181	81	27	12	6	0	3	0

Hesaplamalarda Havran-Balya Fay Zonu için Tablo 6.5'te tanımlanan değerler ile episantr uzaklığı (Balıkesir fayının çalışma alanına ortalama uzaklığı) 20 km ve odak derinliği (ortalama olası deprem derinliği) 15 km değerlerinin Poisson Olasılık hesabında kullanılması ile elde edilen magnitüd değerleri için (DD-1 için Mw=9.6, DD-2 için Mw=8.5, DD-3 için Mw= 7.4) hem Vs30 hız değeri kullanılmadan eski nesil ivme azalım ilişkilerinden hem de Vs30 hız değerleri ile yeni nesil ivme azalım

ilişkilerinden elde edilen PGA değerleri ile TBDY (2018) temel alınarak hesaplanan PGA değerleri aşağıda verilmiştir.

- 50 yılda aşılma olasılığı %2 ve tekrarlanma periyodu 2475 yıl için M = 9.6 kullanılarak farklı araştırmacılar tarafından elde edilen PGA değerlerinin 3 başlık altında tanımlanması gerekir.

  1. Zemin etkisi (Vs30 hız değerleri) dikkate alınmadan eski nesil ivme azalım ilişkilerinden hesaplanmış PGA değerleri:

     - **Donavan (1973)** **PGA=1.96 g**
     - **Olivera (1974)** **PGA=1.42g**
     - **Joyner ve Boore(1981)** **PGA=2.99g**
     - **Campbell (1997) için** **PGA=2.36g**

  2. Türkiye Bina Deprem Yönetmeliği (2018) kullanılarak mühendislik anakaya seviyesi için (VS>760m/s.) tanımlanmış PGA değeri:

     - **TBDY 2018** **PGA=0.650g**

  3. Zemin etkisi (Vs30 hız değerleri), fay tipleri ve anakaya kalite faktörü dikkate alınarak yeni nesil ivme azalım ilişkilerinden hesaplanmış zemin yüzeyine ait PGA değeri:

     - **Graizer, V. ve Kalkan, E. (2016) PGA=0.53g**

Bu deprem seviyesi için hesaplanmış tüm PGA değerleri European Seismological Commision (ESC) tanımlanan PGA (ivme) kriterlerine göre yüksek tehlike sınıfına girmektedir.

- 50 yılda aşılma olasılığı %10 tekrarlanma periyodu 475 yıl için M = 8.5 kullanılarak:

2. Farklı araştırmacılar tarafından zemin etkisi (Vs30 hız değerleri) dikkate alınmadan eski nesil ivme azalım ilişkilerinden hesaplanmış PGA değerleri;

   - **Donavan (1973)** **PGA=0.94g**
   - **Olivera (1974)** **PGA=0.59g**
   - **Joyner ve Boore(1981)** **PGA=1.59g**
   - **Campbell (1997)** **PGA=1.19g**

3. Türkiye Bina Deprem Yönetmeliği (2018) kullanılarak mühendislik anakaya seviyesi için (VS>760m/s.) tanımlanmış PGA değeri:

   - **TBDY 2018 için** **PGA=0.347g**

4. Zemin etkisi (Vs30 hız değerleri), fay tipleri dikkate alınarak yeni nesil ivme azalım ilişkilerinden zemin yüzeyi için hesaplanmış PGA değeri;

   - **Graizer, V. Ve Kalkan, E. (2016)PGA= 0.45g**

Bu deprem seviyesi için hesaplanmış PGA değerleri European Seismological Commision (ESC) tanımlanan PGA (ivme) kriterlerine göre yüksek tehlike sınıfına girmektedir.

- 50 yılda aşılma olasılığı %50 tekrarlanma periyodu 72 yıl için M=7.4 kullanılarak

  1. Eski nesil azalım ilişkilerinden Vs30 hız değerleri kullanılmadan farklı araştırmacılar tarafından elde edilen PGA değerleri;

     - **Donavan (1973)** **PGA=0.45g**
     - **Olivera (1974)** **PGA=0.24g**

- **Joyner ve Boore(1981)** **PGA=0.85g**
- **Campbell (1997)** **PGA=0.57g**

2. Türkiye Bina Deprem Yönetmeliği (2018) kullanılarak mühendislik anakaya seviyesi için (VS>760m/s.) tanımlanmış PGA değeri:
   - **TBDY 2018 için** **PGA=0.137g**
3. Zemin etkisi (Vs30 hız değerleri), fay tipleri dikkate alınarak yeni nesil ivme azalım ilişkilerinden zemin yüzeyi için hesaplanmış PGA değeri;
   - **Graizer, V. ve Kalkan, E. (2016) PGA= 0.44g**

Bu deprem seviyesi için hesaplanmış PGA değerleri European Seismological Commision (ESC) tanımlanan PGA (ivme) kriterlerine göre orta-yüksek tehlike sınıfına girmektedir.

7. SONUÇLAR

Bu Rapor, Balıkesir ili, Balya İlçesi 201900265 (ER:3372769) ve 202201688 (ER:3421641) Ruhsat Numaralı Sahalarda Karlık Altın-Gümüş Madeni Açık ve Yeraltı Ocakları, Cevher Zenginleştirme Tesisi (Tank Liçi, ADR, Kırma-Eleme Tesisi), Atık Depolama Tesisi, (Beton Santralleri ve Mobil Kırıcı Dahil) Projesi (Proje) ÇED Raporu Kapsamında Alanın Depremselliği ve Sismik Tehlike Analizi hakkındaki danışmanlık çalışmalarını kapsar.

Bu kapsamda yapılan çalışmaların sonucunda sahaya özgün sismik tehlike analizi için kullanılacak sismik kaynağın ruhsat alanına ruhsat alanına uzaklığı ortalama 11 km. ve uzunluğu da ortalama 84 km olan Havran Balya Fay Zonu olduğuna karar verilmiştir. Ruhsat alanında yapılan raporda Sismik Tehlike Analizi çalışmasının izlencesi aşağıdaki gibi uygulanmıştır.

- Ruhsat sahası ve çevresindeki bölgesel ve yerel jeolojik ve depremsellikle ilgili literatür çalışmaları yapıldı.
- Aletsel ve tarihsel deprem verileri ortalama 100km. Yarıçaplı alan için düzenlendi.
- Yakın ve uzak alan deprem kaynak haritası oluşturuldu.
- Arazide çalışma alanı ve çevresindeki jeolojik yapılarda gözlem ve incelemeler yapıldı.
- Deterministik ve Olasılıksal Sismik Tehlike Analizleri yapıldı.
- Sahaya özgün sismik tehlike analizi için ruhsat alanının yerel zemin sınıflamasına yönelik arazi ölçüm ve gözlem çalışmaları yapıldı.
- Arazi ölçümleri için, ruhsat alanında 14 noktada tek nokta mikrotremor ölçümleri yapılarak gözlemsel zemin transfer spektrumları (HVSR(f)) elde edilmiştir. Elde edilen HVSR(f) spektrumlarından 14 nokta için hesaplanan Vs30 hız değerlerinden TBDY 2018 kapsamında tanımlanan zemin tipleri belirlenmiştir.
- Eski nesil ivme azalım ilişkileri kullanılarak ortalama PGA değerleri hesaplanmıştır.
- Sahaya özgün değerlendirme yapmak için, Havran-Balya Fay zonu ve Vs30 hız değerlerinin yeni nesil ivme azalım ilişkilerinde kullanıldığı Graizer, V. ve Kalkan, E. (2016) çalışmasında, her bir ölçüm noktası için %5 sönüm oranı

kullanılarak hesaplanan Pseudospectral Acceleration Response Spectrum grafikleri elde edilmiştir.

1. Ruhsat Alanı merkez kabul edilerek oluşturulan 100 km çaplı daire içerisinde aletsel dönemde M>=4 Olan 309 adet deprem kaydı saptanmıştır.

2. Bunlar içerisinde en büyük deprem Mw:7.3 büyüklüğündeki 1912 Şarköy-Tekirdağ depremidir. Kuzey Anadolu Fay Zonu' nun neden olduğu bu deprem deprem nedeniyle 200'den fazla kişi hayatını kaybetmiştir.

3. Kandilli Rasathanesi ve Deprem Araştırma Enstitüsü Ulusal Deprem İzleme Merkezi (UDİM) den toplanan katalog verileri değerlendirildiğinde, aletsel dönem içerisinde magnitüdü 5 ile 6 arasında 17 adet magnitüdü 7 ile 7.5 arasında 3 adet depremin gerçekleştiği görülmektedir.

4. Sahaya özgün Sismik Tehlike Analizi için, Balıkesir yakınındaki ruhsat alanı merkez kabul edilecek şekilde 100 km çaplı daire içinde kalan sismik kaynaklardan Havran-Balya Fay zonu en yakın sismik kaynak olarak kabul edilmiştir.

5. Standart koşullarda yapılan Deterministik Sismik Tehlike Analizi (DSTA) içeriğinde ruhsat alanı merkez olmak üzere 100 km yarıçap içerisindeki bütün olası deprem kaynakları (diri faylar) tanımlanmıştır.

6. Standart koşullarda yapılan olasılıksal deprem tehlike analizi için ruhsat alanı merkez olacak şekilde 100 km yarıçapındaki sismotektonik bölgede aletsel döneme ait 125 yıl içinde oluşmuş ve M değeri 4 ve daha büyük olan 309 adet deprem kullanılmıştır.

7. Sahaya özgün çalışma kapsamında ruhsat sahasında 14 noktada tek istasyon ölçüm tekniği ile 3 bileşen mikrotremor ölçümleri yaptırılmıştır.

8. Mikrotremor ölçümleri sonucunda elde edilen HVSR(f) spektrumlarının ters çözümü sonucunda 14 nokta için elde edilen Vs30 hız değerlerinin ortalama olarak 609.71 m/s-1020.23 m/s arasında değiştiği gözlemlenmiştir. Buna bağlı olarak TBDY (2018) zemin sınıflamasına göre ZB ve ZC zemin sınıflarına giren noktalar gözlemlenmiştir.

9. Ayrıca hem bu değerlere hem de HVSR(f) spektrumlarındaki genlik frekans değişimlerine göre bazı noktalarda mühendislik anakaya derinliğinin (Vs>760m/s) 30 metreden daha derinde olma olasılığı bulunmaktadır.

10. Proje alanında tesisler için zemin dinamik analizi yapılırken kullanılacak zemin mühendislik anakayası modeli hazırlanırken bu sonuçların dikkate alınması önerilir.

11. Hesaplarda ruhsat alanına özgün zemin mühendislik anakayası modelinin hazırlanıp kullanılması gerekmektedir.

12. Sahaya özgü sismik tehlike analizi değerlendirmesi için;

    a. Ruhsat sahasına en yakın olan Havran-Balya Fay Zonu (ortalama 11 km uzaklıkta),

    b. Sahaya özgün ölçümlerle elde edilen Vs30 hız değerleri,

    c. Bölgesel kalite faktörü (Akinci ve diğ. 2006),

    d. Fay türünün hesaplamalara dahil edimesi gerekir.

13. Bu çalışmada kullanılan yeni azalım ilişkilerinde yukarıda tanımlanan kriterler çalışma alanına özgün olarak kullanılmıştır (Graizer ve Kalkan (2016)) .

14. Her bir mikrotremor ölçüm noktası için %5 sönüm oranı kullanılarak DD-1 (Oluşabilecek En Büyük Tasarım Depremi-MCE) deprem seviyesi için hesaplanan Pseudospectral Acceleration Response Spektrum grafiklerinde T=~0.42s-0.55s periyot değerleri arasında maksimum hesaplanan PSA değerleri 1.15 g-1.3g arasında değişirken T = 0 sn periyodundaki PGA değerleri ise 0.47g-0.53g değerleri arasında değişmektedir. Bu değer TBDY (2018) için 0.650g olarak tanımlanmıştır.

    Her bir mikrotremor ölçüm noktası için %5 sönüm oranı kullanılarak DD-2 (Tasarım-Depremi-MDE) deprem seviyesi için hesaplanan Pseudospectral Acceleration Response Spektrum grafiklerinde T=~0.28s- 0.36sn periyot değerleri arasında maksimum hesaplanan PSA değerleri 0.55g-1.08g arasında değişirken T = 0 sn periyodundaki PGA değerleri ise 0.39g-0.45g değerleri

arasında değişmektedir. Bu değer TBDY (2018) için 0.347g olarak tanımlanmıştır.

15. Her bir mikrotremor ölçüm noktası için %5 sönüm oranı kullanılarak DD-3 (İşletmeye Esas Tasarım Depremi-OBE) deprem seviyesi için hesaplanan Pseudospectral Acceleration Response Spektrum grafiklerinde T=~0.18 s-0.24sn periyot değerleri arasında maksimum hesaplanan PSA değerleri 0.93g-1.05g arasında değişirken T = 0 sn periyodundaki PGA değerleri ise 0.39g-0.44g değerleri arasında değişmektedir. Bu değer TBDY (2018) için 0.137g olarak tanımlanmıştır.

Sonuç olarak bu alanlarda yapılacak yapıların tasarım ve yapım aşamasında kullanılacak deprem seviyelerinin seçimi yapılırken söz konusu bu tesislerin kullanım amaçlarına göre seçim yapılması gerekir. Bunun için Proses atığı depolama alanlarının tasarımı için Maden Atıkları Yönetmeliği çerçevesinde tanımlanan kriterlere göre deprem seviyesi için sonuçlar bölümünde hesaplama sonuçları ayrıntılı olarak tanımlanan DD-1 (MCE) veya DD-2 (MDE) seviyelerinden birinin seçilmesi önerilir. Diğer yapılarda ise DD-2 (MDE) seviyesinin seçilmesi önerilir.

Proje Adı / Cihaz Kurulum Noktası Project Name / Sampling Location	Balıkesir Karlık Maden Projesi / Karlık	**Ölçüm Yapıldığında Çevre Şartları / Environmental Conditions During Sampling**	Rüzgarlı
Ölçümü Yapan Kişi / Person Conducted Sampling	Serhad İNCEDERE		
Ölçümde Uygulanacak Standart ve Kaynaklar / Standard and Resources Applied in Measurement	TS EN 12341	**Dolu Filtrenin Laboratuvara Geldiği Tarih/Saat Date/Time the Final Filter Arrives at Laboratory**	06.09.2021 18:00
Boş Filtrenin Tartıldığı Tarih Date of Empty Filter Weighing	23.08.2021 12:00	**Dolu Filtrenin Tartıldığı Tarih Date of Final Filter Weighing**	08.09.2021 12:00

Açıklamalar/Remarks:

Deney laboratuvarı olarak faaliyet gösteren ENCON Laboratuvarı A.Ş. TÜRKAK' tan AB-0168-T ile TS EN ISO/IEC 17025 standardına gore akredite edilmiştir. ENCON Laboratuvarı A Ş is accredited by TÜRKAK under registration number AB-0168-T for TS EN ISO/IEC 17025 as a test laboratory

Türk Akreditasyon Kurumu (TÜRKAK) deney raporlarının tanınırlığı konusunda Avrupa Akreditasyon Birliği (EA) ile Çok Taraflı Anlaşma ve Uluslararası laboratuvar Akreditasyon Birliği (ILAC) ile karşılıklı tanıma anlaşması imzalamıştır. Turkish Accreditation Agency (TURKAK) is a signatory to the European co-operation for Accreditation (EA) Multilateral Agreement (MLA) and to the International Laboratory Accreditation Cooperation (ILAC) Mutual Recognition Arrangement (MRA) for the recognition of test reports.

Deney ve /veya ölçüm sonuçları, genişletilmiş ölçüm belirsizlikleri (olması halinde) ve deney metotları bu sertifikanın tamamlayıcı kısmı olan takip eden sayfalarda verilmiştir. The test and/or measurement results, the uncertainties (if applicable) with confidence probability and test methods are given on the following pages which are part of this report

DENEY RAPORU / Test Report

A. GİRİŞ

ENCON Laboratuvarı A.Ş. tarafından 2 noktada yapılan pasif örnekleme ile NO_2 ve SO_2 analizleri yapılmıştır.

B. ÖLÇÜM YAPILAN BÖLÜM, ÖLÇÜM PARAMETRELERİ, ÖLÇÜM YÖNTEMİ VE ÖLÇÜM CİHAZI VE SONUÇLARI

Ölçüm yapılan noktalara ait koordinatlar tablo-1 de verilmiştir.

Tablo 1: Ölçüm Noktası Koordinatları

Ölçüm Noktası	Koordinatlar
Söbücealan	35S 0564387 4407309
Karlık	35S 0563006 4409020

Analizde kullanılan ölçüm yöntemi tablo-2 de verilmiştir.

Tablo 2: Ölçüm Parametresine Göre Analiz Yöntemleri

Ölçüm Parametresi	Analiz Yöntemi	Örnekleme
*NO_2 ve SO_2 Analizi	Pasif Analiz Yöntemi (TS EN 13528-1, TS EN 13528-2, TS EN 13528-3, İşletme İçi Metot TA.152)	Pasif örnekleme tüpleri ile örnekleme

*işaretli örneklemeler ENCON Laboratuvarı A.Ş. tarafından yapılmış olup, analizler laboratuarımızda akreditasyon kapsam dışı yapılmıştır.

C. ÖLÇÜM SONUÇLARI

Tablo 3: Ölçüm Sonuçları

Ölçüm Noktası	NO_2 (µg/m^3)	SO_2 (µg/m^3)
AQ-1	6,63	155
AQ-2	3,44	92,8

Laboratuar, yetkili personeli tarafından alınmayan ve/veya uygun koşullarda gelmeyen numunelerden, teknik ve hukuki olarak sorumluluk kabul etmemektedir.
Laboratuarımız tarafından alınmayan numunelere ait ölçüm belirsizliği değerleri, numune almadan kaynaklanan belirsizlik değerleri dahil edilmeden belirtilmiştir.

Su numunesi TS EN ISO 5667-6 TS ISO 5667-4. TS ISO 5667-11. atıksu numunesi TS ISO 5667-10 deniz suyu numunesi TS ISO 5667-9. çamur numunesi TS EN ISO 5667-13. katı atık numunesi TS 12090. toprak numunesi TS 9923 ve sediment numunesi TS 9547 ISO 5667-12 standartlarına gore alınmaktadır.
ENCON Laboratuvarı A.Ş. tarafından alınmayan numuneler için belirtilen ölçüm belirsizliği değerlerine numune almadan kaynaklanan belirsizlik değerleri dahil edilmemektedir.
Laboratuvar yetkili personel tarafından alınmayan ve/veya uygun koşullarda teslim alınmayan numunelerden teknik ve hukuki olarak sorumluluk kabul etmemektedir. Müşteri tarafından sağlanan bilgilerın hukuki sorumluluğu müşteriye aittir. firmamız bu bilgilerden kaynaklanacak sonuçlardan feragat eder
Water Samples are sampled according to the standards of TS EN ISO 5667-6. TS ISO 5667-4. TS ISO 5667-11. whereas wastewater. sea water. sludge. solid. soil and sediment samples are sampled according to the standard of TS ISO 5667-10. TS ISO 5667-9. TS EN ISO 5667-13. TS 12090 TS 9923 and TS 9547 ISO 5667-12. respectively.
For the samples not taken by the ENCON laboratory Inc.. uncertainty values indicated do not cover the uncertainties arising from the sampling.
The Laboratory does not accept technical and legal responsibility for samples that are not sampled by authorized personnel and/or received under inappropriate conditions The legal responsibility of the information provided by the customer belongs to the customer. our company waives the consequences arising from this information.

Açıklamalar/Remarks:
-İmzasız ve kaşesiz Deney Raporları geçersizdir / Reports without signature and/or stamp are not valid
-Rapordaki analiz sonuçları laboratuvara teslim edilen deneyi yapılan numuneye aittir / Results given in thiş report represents the results of the analyses of the samples received
-Bu rapor ve sonuçları ENCON Laboratuvarı A.Ş.'nin izni olmadan ticari ve reklam amaçlı tamamen veya kısmen çoğaltılamaz veya yayınlanamaz / This report and results given in this report cannot be reproduced for commercial or advertising purposes without prior consent of ENCON Laboratory Inc.

Müşteri Adı / Adresi Client Name / Address	Encon Çevre Danışmanlık Ltd. Sti. Resit Galip Cad. No:120 Gaziosmanpaşa CANKAYA/ANKARA
Rapor Tarihi / Sayfa Sayısı Report Date / Number of Pages	14/09/2021 / 3
Numune Kayıt No Sample Record Number	NUM.21.0869
Numuneyi Alan Kurum / Kuruluş Sampler Institution / Company	ENCON Laboratuvarı A.S.
Numune Alınan Yer Sampling Location	Balıkesir Karlık Maden Projesi
Numune Türü / Numune İşareti Sample Type / Sample Sign	Su / Tütünlük-1 DS-10
Numunenin Alınış Şekli Sampling Type	Anlık numune
Numuneyi Alan Person Conducted Sampling	Serhad İncedere
Numune Alma / Kabul Tarihi Sampling Date / Date of Samples Received	03.08.2021 / 04.08.2021
Numunenin Teslim Koşulları Delivery Conditions of the Sample	1.0 L, Mühürsüz, Plastik Sise, Soguk Koruma; 1.0 L, Mühürsüz, Cam Sise, Soguk Koruma; 1.0 L, Mühürsüz, Plastik Sise, Soguk Koruma+H2SO4; 500.0 mL, Mühürsüz, Cam Sise, Soguk Koruma+Cinko Asetat Korumalı; 200.0 mL, Mühürsüz, Steril Sise, Soguk Koruma; 200.0 mL, Mühürsüz, Steril Sise, Soguk Koruma; 500.0 mL, Mühürsüz, Plastik Sise, NaOH Korumalı; 1.0 L, Mühürsüz, Cam Sise, Soguk Koruma+HCl; 100 0 mL, Mühürsüz, Cam Sise, Soguk Koruma+HCl; 250.0 mL, Mühürsüz, Plastik Sise, Soguk koruma+HNO3
Numune Alımında Çevre Şartları Environmental Conditions During Sampling	Açık
Açıklamalar Remarks	Müşteri talebi üzerine özel istek numunesi olarak çalışılmıştır. Bu rapor çevre mevzuatına ilişkin resmi işlemlerde kullanılamaz.
Deneyin Yapıldığı Tarih Date of Test	04.08.2021 - 13.08.2021

Deney laboratuvarı olarak faaliyet gösteren ENCON Laboratuvarı A.Ş. TÜRKAK' tan AB-0168-T ile TS EN ISO/IEC 17025 standardına gore akredite edilmiştir ENCON Laboratuvarı A.Ş. is accredited by TURKAK under registration number AB-0168-T for TS EN ISO/IEC 17025 as a test laboratory

Türk Akreditasyon Kurumu (TÜRKAK) deney raporlarının tanınırlığı konusunda Avrupa Akreditasyon Birliği (EA) ile Çok Taraflı Anlaşma ve Uluslararası laboratuvar Akreditasyon Birliği (ILAC) ile karşılıklı tanıma anlaşması imzalamıştır. Turkish Accreditation Agency (TURKAK) is a signatory to the European co-operation for Accreditation (EA) Multilateral Agreement (MLA) and to the International Laboratory Accreditation Cooperation (ILAC) Mutual Recognition Arrangement (MRA) for the recognition of test reports

Deney ve /veya ölçum sonuçları, genişletilmiş ölçüm belirsizlikleri (olması halinde) ve deney metotları bu sertifikanın tamamlayıcı kısmı olan takip eden sayfalarda verilmiştir The test and/or measurement results the uncertainties (if applicable) with confidence probability and test methods are given on the following pages which are part of this report
